

INTERNAL REPORT 7

IDENTIFICATION AND CHARACTERIZATION OF FOREST COMMUNITIES AND HABITAT TYPES
IN AND ADJACENT TO THE H. J. ANDREWS EXPERIMENTAL FOREST

C. T. Dyrness
Jerry F. Franklin
Donald Zobel
Oregon State University

Identification and Characterization of Forest Communities

A total of 23 forest communities have been identified and characterized in a preliminary manner. Data used in formulating the classification had previously been collected on 300 reconnaissance plots located on the H. J. Andrews Forest and surrounding area. Vegetation classification was facilitated by similarity analysis and stand ordination procedures developed by Dr. Will Moir, formerly of Colorado State University. Results of stand ordination indicate the presence of strong moisture and temperature gradients along which forest stands array themselves.

The forest communities recognized in this classification are listed below. They are considered to be climax associations except where indicated. Main characteristics of each unit are shown in the attached summary table.

Tsuga heterophylla zone

1. Pseudotsuga menziesii/Holodiscus discolor^{1,2}
2. Pseudotsuga menziesii-Tsuga heterophylla/Corylus cornuta¹
3. Tsuga heterophylla/Castanopsis chrysophylla^{1,2}
4. Tsuga heterophylla/Rhododendron macrophyllum/Gaultheria shallon^{1,2}
5. Pseudotsuga menziesii/Acer circinatum/Gaultheria shallon (seral)
6. Tsuga heterophylla/Rhododendron macrophyllum/Berberis nervosa^{1,2}
7. Pseudotsuga menziesii/Acer circinatum/Berberis nervosa (seral)¹
8. Tsuga heterophylla/Acer circinatum/Polystichum munitum^{1,2}
9. Tsuga heterophylla/Polystichum munitum²
10. Tsuga heterophylla/Polystichum munitum-Oxalis oregana¹

Transitional zone

1. Tsuga heterophylla-Abies amabilis/Rhododendron macrophyllum/Berberis nervosa^{1,2}
2. Tsuga heterophylla-Abies amabilis/Rhododendron macrophyllum/Linnaea borealis
3. Tsuga heterophylla-Abies amabilis/Linnaea borealis^{1,2}
4. Pseudotsuga menziesii/Acer circinatum/Whipplea modesta (seral)

Abies amabilis zone

1. Abies amabilis-Tsuga mertensiana/Xerophyllum tenax¹
2. Abies amabilis/Vaccinium membranaceum/Xerophyllum tenax
3. Abies amabilis/Rhododendron macrophyllum-Vaccinium alaskaense/Cornus canadensis
4. Abies amabilis/Vaccinium alaskaense/Cornus canadensis¹
5. Abies procera/Achlys triphylla
6. Abies amabilis/Achlys triphylla
7. Abies procera/Clintonia uniflora (seral)
8. Abies amabilis/Tiarella unifoliata^{1,2}
9. Chamaecyparis nootkatensis/Oplopanax horridum

Communities marked with ¹ each have an established reference stand in which intensive environmental monitoring is currently under way. Observations made in these 14 reference stands include air and soil temperature, plant moisture stress, nutrient content of foliage, and phenology. For preliminary results of these measurements see Zobel's progress report for year-1 project entitled "Relation of biologically defined environmental measurements to distribution and productivity of forest ecosystems in the central Oregon Cascades."

Stands in communities marked with ² are currently being used by Dr. Denis Lavender in his study of litterfall and nutrient cycling in old-growth Douglas-fir stands. In most cases these plots are located in close proximity to reference stands.

We are currently preparing a manuscript entitled "Forest communities of the central portion of the western Cascades in Oregon," which will summarize methods used in classifying the vegetation and give detailed descriptions of the communities. It is anticipated that this manuscript will be published as a Coniferous Biome bulletin.

A by-product of work on this study has been the publication of "A checklist of vascular plants on the H. J. Andrews Experimental Forest, western Oregon" by Jerry F. Franklin and C. T. Dyrness (U.S. Forest Serv. Res. Note PNW-138, January 1971, 37 p.).

Vegetation Mapping on Experimental Watersheds

Most of this work was accomplished by Mr. Glenn Hawk (graduate student in botany at Oregon State University), who was employed for this purpose during the summers of 1970 and 1971. Watersheds that have been mapped include: (1) experimental watersheds 2 and 3, largely consisting of old-growth Douglas-fir forest at elevations of approximately 1,500 to 3,000 feet (total area about 400 acres), and (2) experimental watersheds 6, 7, and 8 (collectively known as the "Hi-15 watersheds") largely consisting of second-growth (130 year old) Douglas-fir forest at elevations of approximately 3,000 to 3,500 feet (total area about 170 acres).

Those units recognized in our classification of forest communities were found to provide a logical and useful framework for mapping vegetation in these areas. Information shown for each map delineation includes forest community, amounts of tree regeneration in the understory, and characteristics of the tree overstory, including species composition, tree age class, and canopy coverage. Characterization of mapping units is based on data collected on 125 reconnaissance plots, which were established and described during the course of the field survey work. These plots are distributed over the entire mapped area and their location is indicated on the maps. Information recorded for each reconnaissance plot included an estimate of coverage of each plant species present, slope, aspect, and a brief description of soil profile characteristics.

Forest communities found in significant amounts on watersheds 2 and 3 are Pseudotsuga menziesii/Holodiscus discolor, Tsuga heterophylla/Castanopsis chrysophylla, Tsuga heterophylla/Rhododendron macrophyllum/Gaultheria shallon, Pseudotsuga menziesii/Acer circinatum/Gaultheria shallon, Tsuga heterophylla/Rhododendron macrophyllum/Berberis nervosa, Pseudotsuga menziesii/Acer circinatum/Berberis nervosa, Tsuga heterophylla/Acer circinatum/Polystichum munitum, and Tsuga heterophylla/Polystichum munitum. Forest vegetation on watersheds 6, 7, and 8 falls primarily into three communities: Tsuga heterophylla-Abies amabilis/Rhododendron macrophyllum/Berberis nervosa, Pseudotsuga menziesii/Acer circinatum/Berberis nervosa, and Pseudotsugamenziesii/Acer circinatum/Whipplea modesta.

The vegetation maps are currently being drafted in final form at a scale of about 32 inches to the mile. Descriptive material accompanying the maps will include descriptions of the principal mapping units, a summarization of reconnaissance plot data, and an estimate of acreages within the various map units.
