I. List of Shore Stations .....	3
II. Temperature and Salinity Observations .....	10
III. Monthly Mean Temperature and Salinity .....	14

## INTRODUCTION

During 1971 the Department of Oceanography, Oregon State University, continued its program of shore sampling of ocean temperatures and salinities along the coast of the Pacific Northwest. Observations for 1960 through 1970 are contained in nine Data Reports which are listed following the references. The data in this report were collected at six stations. Table I lists the station names and locations, sampling sites, and names of the observers at each station. The assistance of these observers is greatly appreciated.

## PROCEDURE

The original goals of the shore sampling program were to obtain basic information about the distribution of temperature and salinity along the coast and to aid in monitoring offshore conditions. Detailed analysis of the early data showed that we can classify Oregon coastal waters into several types according to the major processes that affect them (Pattullo and Denner, 1965). These results led us to modify the sampling program to provide us with more detailed data.

In 1971 data were taken daily, and generally at high tide. Except as noted in Table I, sampling sites were located at points exposed to the open ocean where the influence of fresh water runoff was minimal.

Temperatures were read to the nearest 0.1C with a calibrated thermometer. The observations are considered accurate to approximately  $\pm 0.2C$ .

Most salinity data were computed from hydrometer readings and tables (Zerbe and Taylor, 1953). Hydrometers were calibrated against an inductive salinometer which has an accuracy of about  $\pm 0.003\%$  (Brown and Hamon, 1961). The accuracy of salinity determined by a corrected hydrometer is about  $\pm 0.2\%$  determined by running replicate samples on an inductive salinometer. Newport salinities were bottled samples run on an inductive salinometer.

Table II lists chronologically all the observations taken at each coast station in 1971. Table III is a summary of monthly means, maxima, minima, and numbers of observations for each station. All times are Pacific Standard Time (+ 8) except those from 0200 25 April to 0200 31 October 1970 when Daylight Standard Time was in effect (+ 7).

Figures 1 through 6 are plots of the temperature and salinity data appearing in Table II. A light line is used in the graph to represent the yearly mean of the plotted values. The cyclic appearance of some of the data results from the samples being taken at the same time each day. Future data will be taken at high tide.

## 13. ABSTRACT

During 1971 the Department of Oceanography, Oregon State University, continued its program of shore sampling of ocean temperatures and salinities along the coast of the Pacific Northwest. Daily observations for six stations are listed along with monthly maxima, minima, means and standard deviations of temperature and salinity.
