Abstract

As part of the SuperCODE and CODE projects, two hydrographic cruises were conducted off Oregon and California in January and April 1984. CTD sections across the continental shelf and slope were made near Coos Bay at $43^{\circ}13'N$, off Crescent City at $41^{\circ}54'N$, off Eureka at $40^{\circ}51'N$, along the Arena and Code Central lines near $39^{\circ}N$, off of Half Moon Bay at $37^{\circ}25'N$ and off Pt. Purisima at $34^{\circ}45'N$ during 11-15 January 1983 and 9-16 April 1983. CTD observations were made off San Diego at $32^{\circ}43'N$ on 16 January 1983, along the Calcofi-90 line near $33^{\circ}N$ on 6-7 April 1983 and off Newport at $44^{\circ}39'N$ on 17-18 April 1983. Maximum sampling depth was 1000 m. This report includes vertical sections and offshore profiles to summarize the data, and vertical plots and standard depth listings for each of the 162 CTD stations.

INTRODUCTION

The Large Scale West Coast Shelf Experiment (SuperCODE) seeks to describe the larger scale alongshore structure of the currents over the continental shelf between Coos Bay, Oregon and Purisima Pt., California. On a smaller scale, the Coastal Ocean Dynamics Experiment (CODE) has similar objectives for the continental shelf region between Pt. Arena and Pt. Reyes, California. Through the cooperation of these two projects, hydrographic surveys were conducted in SuperCODE and CODE regions (Figures 1 and 2) during January and April of 1983, and current meter moorings were recovered along the Code Central line at $38^{\circ}36'$ and off Eureka at $40^{\circ}51'N$, and replaced near Coos Bay at $43^{\circ}13'N$ from 11-15 April 1983.

The purpose of cruise WELOC 83 Leg 1 was to complete CTD sections with a maximum sampling depth of 1000 meters off of Coos Bay, Oregon and Crescent City, Eureka, Pt. Arena, Sea Ranch, Half Moon Bay, Purisima Pt. and Del Mar, California. The main purposes of WELOC 83 Legs 4, 5 and 6 were to repeat the CODE and SuperCODE CTD sections and to recover current meter moorings off of Sea Ranch, Eureka and Coos Bay. Due to the unusual oceanic conditions during the El Niño, additional purposes were added to Legs 4 and 6 in support of the El Niño del Norte Study. CTD sections were made along the historically repeated CalCOFI Line 90 near San Diego and the Newport Hydro Line off Newport, Oregon. Water samples were collected for oxygen, nutrient, and chlorophyll analysis along CalCOFI Line 90 and for chlorophyll analysis along the Newport Hydro Line. Principal investigators and cruise participants for each leg are listed in Table 1. Only the CTD data are included in this report.

The R/V WECOMA departed on Leg 1 on 10 January 1983 from Newport, Oregon and arrived in San Diego, California on 16 January 1983. From 11 to 16 January

a total of 66 CTD casts (Table 2, Figure 1) were completed along 8 sections: FM, CR, EUR, AR, COC, HM, PR and DM. All casts were conventional CTD casts, except on stations 9 to 14, 51 and 52 a Rosette water sampler holding current meters and a transmissometer was attached to the CTD to test the Rosette system in preparation for legs 2 and 3, and to check the pressure effects on the current meters' conductivity cells.

Cruise WELOC 83 Leg 4 departed San Diego on 5 April 1983 and returned to San Diego on 7 April after completing 11 Rosette-CTD casts along CalCOFI Line 90 (Stations 1-11, Table 3). This leg has been recorded on film by Channel 2 News of Portland, Oregon and was run as a serial "OSU Goes to Sea" during the prime time local news. Although receiving acclaim from the public, it has received mixed reviews from some of the more sophisticated members of the college.

The R/V WECOMA embarked on Leg 5 on 8 April and began a CTD section off Purisima Pt. on 9 April (Stations 12-20; Figure 2, Table 3). On 10 April the Purisima and Half Moon Bay lines were completed and the ship headed for the C-3 mooring site on the CODE Central Line off Sea Ranch. On the morning of 11 April, seven "yo-yo" CTD casts (Stations 30-36, Figure 3) were done at the C-3 site. After an unsuccessful attempt to release the main current meter mooring, a C-3 guard buoy with one current meter was brought aboard and then dragging began for the unreleased mooring. At dark the ship headed for COC-1, and the CODE Central CTD section was completed early on 12 April. After two hours of unsuccessful dragging for the C-3 mooring at daybreak, the second C-3 guard buoy was brought aboard and the ship departed for San Francisco, arriving at Yerba Buena Island in the early evening of 12 April.

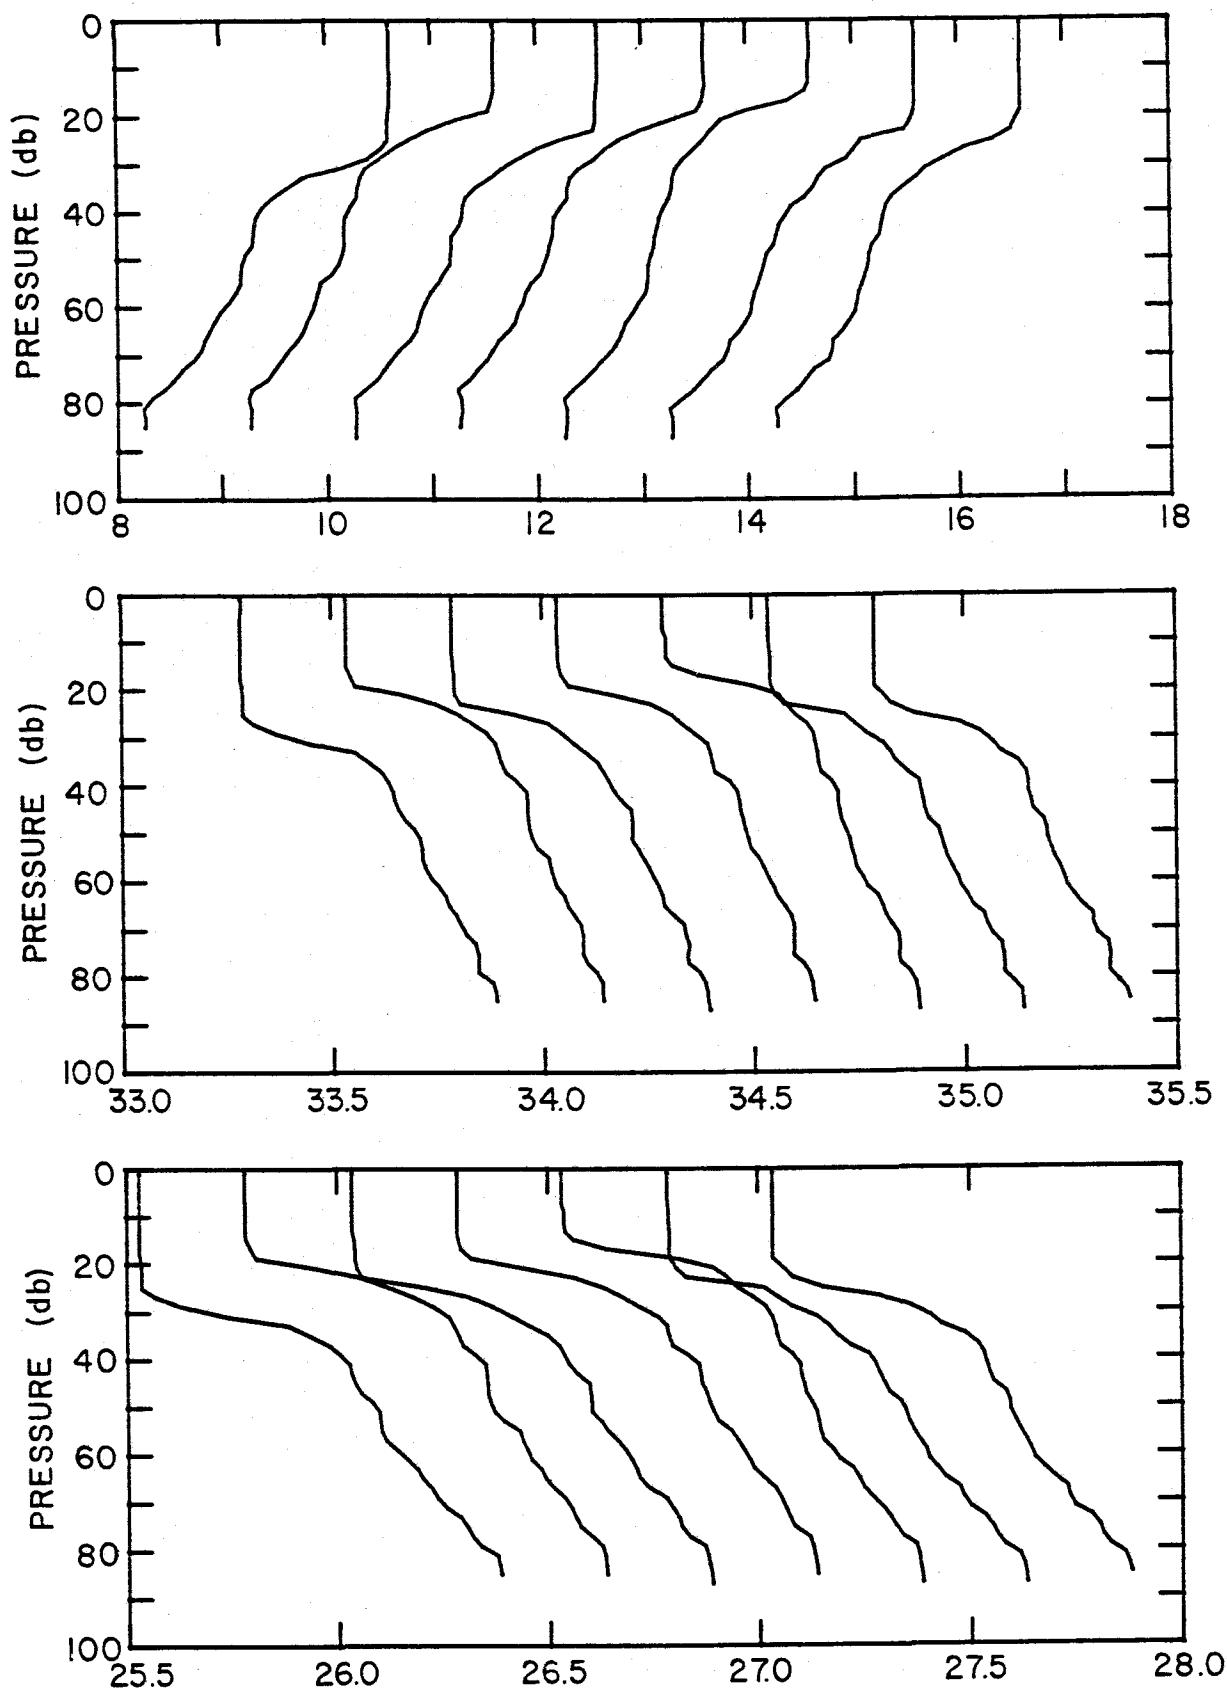

Figure 3. Vertical profiles of Stations 30-36, WELOC 83, Leg 5, near the C-3 mooring, showing temperature, salinity and sigma- θ with offsets of 1°C, 0.25 ‰, and 0.25 respectively for successive stations.

After exchanging mooring personnel, the WECOMA departed on leg 6 of WELOC 83 early on 13 April, headed for the Arena CTD line (Stations 46-52) which was completed that evening. On 14 April the Eureka shallow current meter mooring was recovered and the Eureka CTD section completed (Stations 54-60). The Coos Bay shallow current meter mooring was replaced and Coos Bay (FM) line (Stations 63-71) finished on 15 April. From 16-18 April CTD sections off of Crescent City (Stations 72-80) and Newport (Stations 81-96) were completed, and at noon on 18 April the R/V WECOMA arrived at Newport ending the WECOMA Long Cruise of 1983.

SAMPLING PROCEDURES, CALIBRATION AND DATA PROCESSING

A Neil Brown Instruments Mark IIIb conductivity-temperature depth probe (CTD) was used to obtain continuous profiles of temperature and salinity versus pressure at each station. Sampling procedures were identical with those described by Fleischbein et al. (1981), except that probe #2561 fitted with a 1600 db pressure sensor was used for all stations. Characteristics of the probe used are presented in Table 4. During Leg 4, (Stations 1-11, Table 3) the CTD was equipped with a Beckman dissolved oxygen probe and a Sea Tech, Inc. 25-cm transmissometer (S/N 33D). On Legs 5 and 6 (Stations 12-96) the transmissometer was replaced with a Benthos Model 2110 altimeter.

The CTD probe was calibrated for pressure, temperature and conductivity by the manufacturer in November 1982. *In situ* calibration data were also collected for the temperature and conductivity sensors. At most stations during Leg 1 and all stations of Legs 5 and 6, a Niskin bottle equipped with 3 protected reversing thermometers was mounted about 2 m above the CTD sensors to provide calibration samples. During stations 9-14, 51 and 52 of Leg 1 and 1-11 of Leg 4, a rosette water sampler was mounted with the CTD and water samples were drawn from the Niskin bottles on the rosette. The thermometers have an accuracy of $\pm 0.02^\circ\text{C}$ and are corrected using the results of calibrations done once every 3 years. Water sample salinity is determined by Guildline Model 8400 Autosal salinometers with precision of better than $\pm 0.002\text{‰}$ and accuracy of $\pm 0.003\text{‰}$, using equations given by Bennet (1976).

CTD data are recorded at the actual sample depth after the bottle is tripped. Occasionally due to large wire angles, the CTD and sample bottles

do not remain at the same depth (and temperature) during soak time. When this resulted in relatively large differences between the sample and CTD temperature readings, these points were eliminated from the overall CTD-sample comparisons.

Duplicate salinity samples were drawn from one or more Niskin bottles at each station. All of set #1 of the duplicates from Legs 1, 4, 5 and half of Leg 6 were analyzed at sea on OSU's Autosal #1, and the sample set #1 from stations 65-96 of Leg 6 were run on OSU's Autosal #3. All of set #2 from Leg 1 and every fourth sample of set #2 from Legs 4, 5, 6 were run on Autosal #3 after the cruises to check the results of the analysis of set #1. Since the two sets of samples run were in agreement, no further analysis was done on set #2 and set #1 was used for the final comparison.

Results of the comparison between *in situ* sample data and the CTD output are summarized in Table 5. The sample conductivity was calculated using the CTD temperature and salinity. CTD conductivity was corrected for the pressure and temperature effects on the cell prior to the comparison. The temperature differences for Legs 1, 4, 5 and 6 had a mean of -0.01 which was also the mean difference for Legs 2 and 3 of WELOC 83. These temperature differences are within the sampling and instrument errors but due to the consistency of the mean offset, a post cruise temperature calibration of the CTD probe was done using a water bath and a Mueller Bridge. The calibration results are presented in Table 7, and since the mean temperature difference of +0.004 is within accuracy of the CTD temperature sensor no correction was applied to temperature prior to processing. The conductivity differences had means of $+0.007 \text{ mmhos cm}^{-2}$ (Leg 1) and $+0.006 \text{ mmhos cm}^{-2}$ (Legs 4, 5, 6) and standard deviations of 0.003 and 0.004 mmhos cm^{-2} respectively so conductivity corrections of $+0.007 \text{ mmhos cm}^{-2}$ for Leg 1 and

+0.006 mmhos cm⁻² for Legs 4, 5, 6 were applied to the stations prior to processing the data.

The procedures for data processing the pressure, conductivity and temperature data were described in Gilbert, Huyer and Schramm (1981). The coefficient (α) for the conductivity filter for the probe was 0.900.

	mean	.004
	Std. Dev.	.001

Stations that had a delay or showed a sudden downward jump or shift in conductivity that was probably due to detritus in the cell were edited during processing and are presented in Table 8. These stations also have footnotes to the listings in the body of the data report. The salinity values of Station 59, Leg 1 from 9 to 49 db appear to be offset, but this was not noticed during sampling and since no recast was done, the data was not edited.

The altimeter and transmissometer data acquisition procedures were explained by Fleischbein et al. (1983) and were identical except the transmissometer used had a 25 cm path length. The transmissometer data was calibrated using the manufacturer's original calibration and the post-cruise air calibration data (Table 6) using the formula:

$$\text{VOLTS} = ((\text{AIROLD}/\text{AIRNEW}) * (\text{TVOLT}-\text{ZERO}))$$

where VOLTS is the corrected voltage, AIROLD is the original voltage output in air (4.76 v.), AIRNEW is the post-cruise voltage output in air (4.80 v.), TVOLT is the uncorrected voltage output in air and ZERO is the voltage output of the transmissometer when the light path is blocked (-0.001 v.). The corrected voltage is then converted to a percent transmission by the formula: TRANS = (VOLTS/5)*100.

The oxygen calibration samples were collected for stations 1-11, Leg 4 by technicians from SIO and UCSB, and the oxygen values were provided by Arnold Mantyla of SIO. The calibration of the oxygen sensor followed a procedure similar to that presented by Owens and Millard (1985), and their algorithm:

$$\text{OX} = [\text{Soc} \cdot (\text{oc} + \tau \frac{d\text{O}_c}{dt} + \text{Boc}] \cdot \text{OXSAT}(\text{T}, \text{S}) \cdot e^{[\text{tcor}(\text{t}+\text{wt})(\text{ot}-\text{t}) + \text{pcor} \cdot \text{p}]}$$

The best fit oxygen constants used in processing the data were Boc = .00971671. Soc = 1.58707, pcor = .000497037, tcor = .00666183, wt = -1.40648 and TAU = 0. Vertical profiles of dissolved oxygen and the oxygen sample data are presented for stations 1 - 11, leg 4 on pages 102 to 112.

Table 8. Stations edited during data processing.

<u>Station</u>	<u>Depth</u>	<u>Problem</u>	<u>Remedy</u>
<u>Leg 1</u> 17	670 db	Mag. tape ran out	Stopped cast at 670 db, brought CTD up to 570 db and re-started. 15 min. gap at 647-649 db where recast data was joined to original cast data.
46	60 db	Jump in conductivity	Stopped cast at 66 db, CTD brought up to 25 db and re-started. 4 min. gap at 57-59 db where recast data was joined to original cast data.
<u>Leg 6</u> 82	600 db	Jump in conductivity	Continued cast to 1000 db, made 2nd cast from 500 db to 1000 db. 14 min. gap at 577-579 db where recast data was joined to original cast data.

DATA PRESENTATION

The hydrographic data are summarized in vertical sections and offshore profiles. For each section, we show the vertical distribution of temperature, salinity, and sigma-theta, contoured by hand. Tick marks at the top of each section indicate station positions at which a CTD cast was made, and an inverted "T" mark at the maximum depth of each cast.

For each hydrographic section in Figures 1 and 2, we show offshore profiles of surface temperature, salinity, sigma-theta, and dynamic height at 0, 100 and 200 db relative to 500 db. Dynamic height at shallow stations was computed using the extrapolation method described by Reid and Mantyla (1976); the extrapolated portion of each profile is dashed.

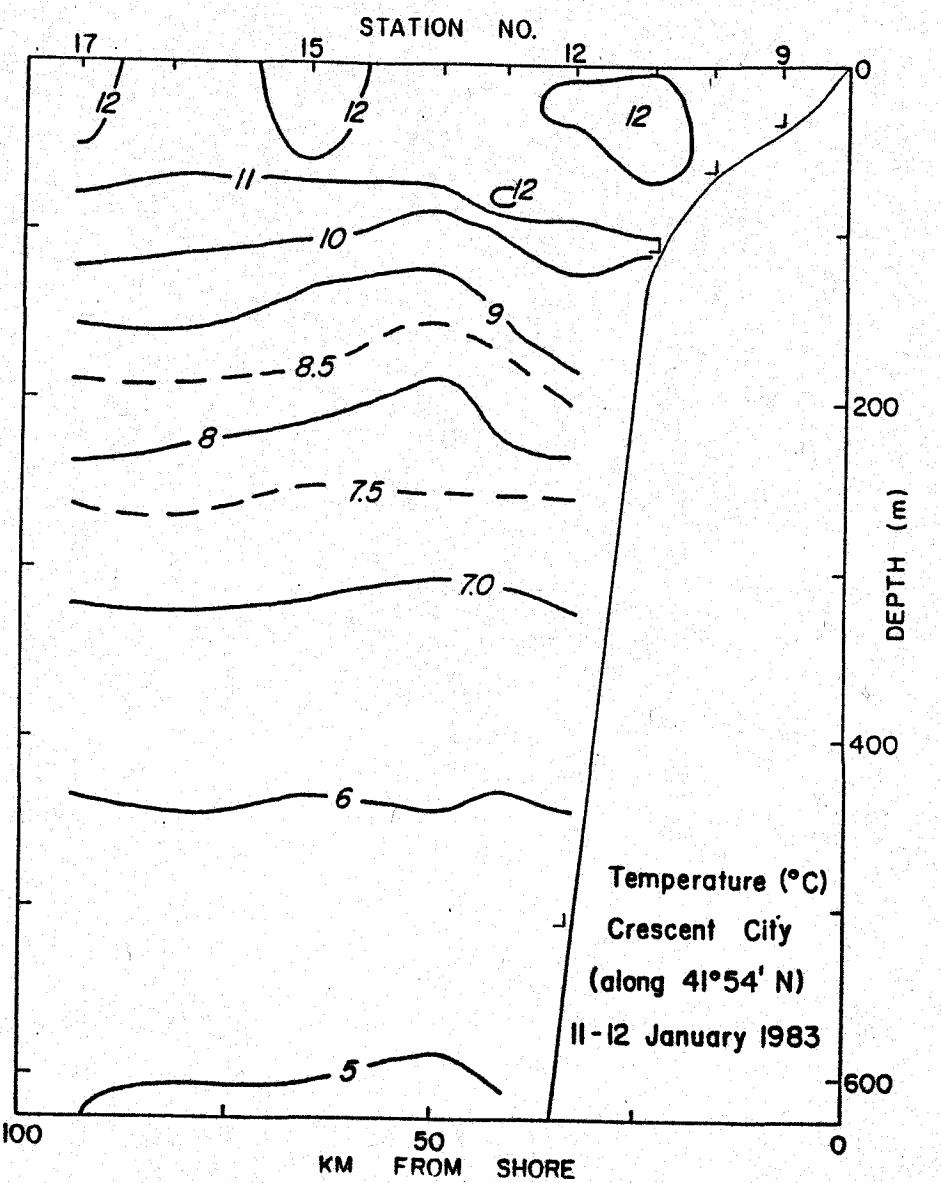

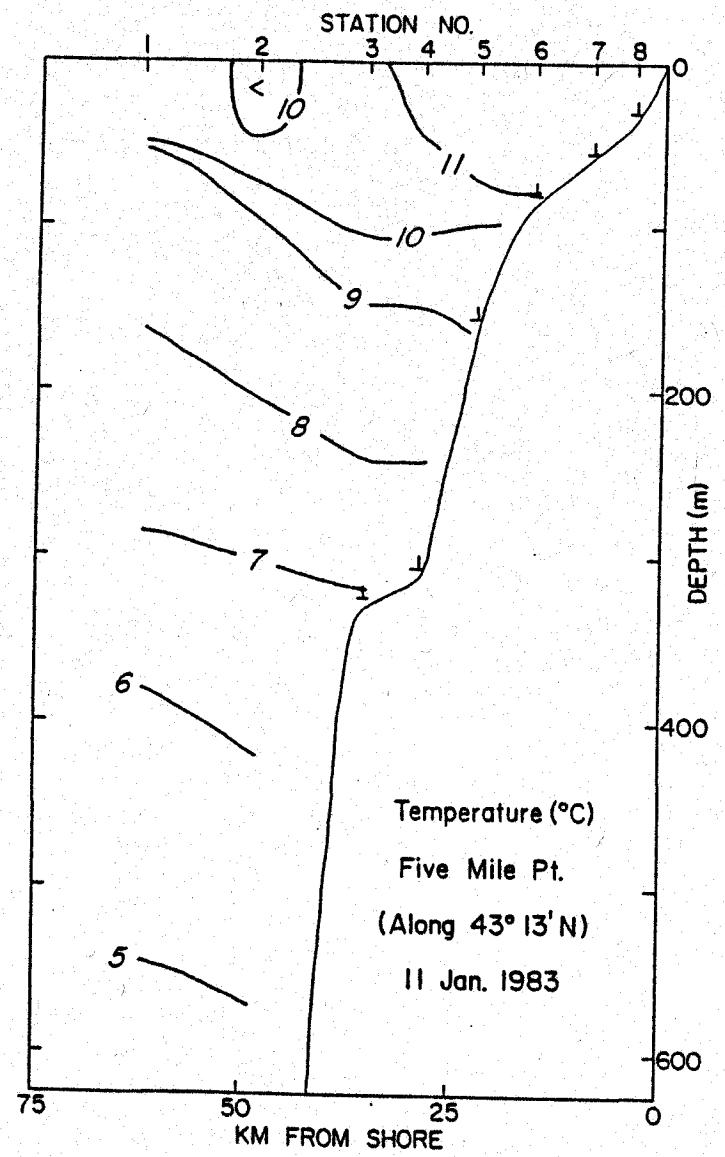

Vertical profiles of temperature, salinity and sigma-theta vs. pressure are shown for each station. Header information for each station is as follows:

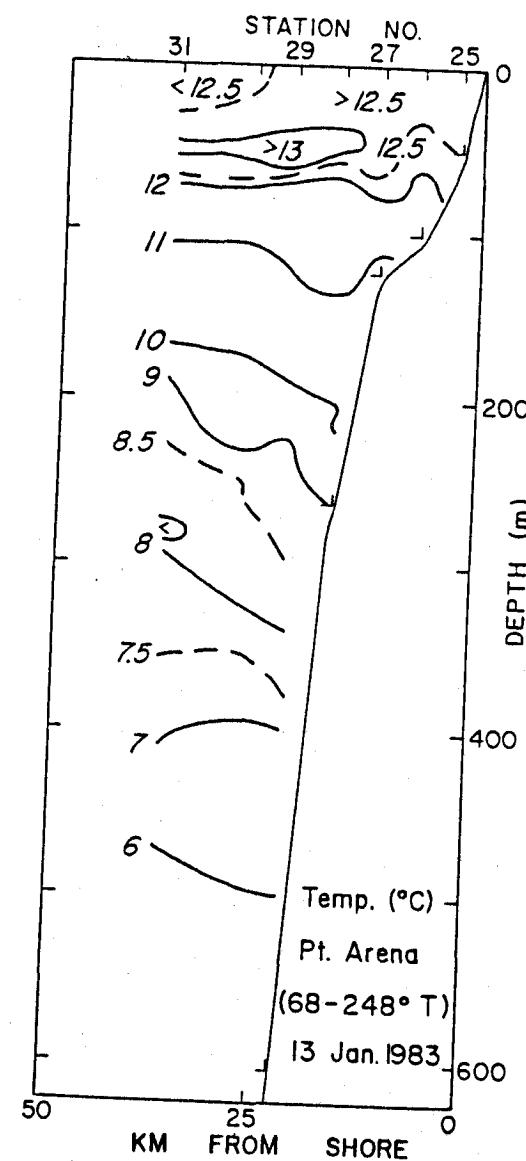

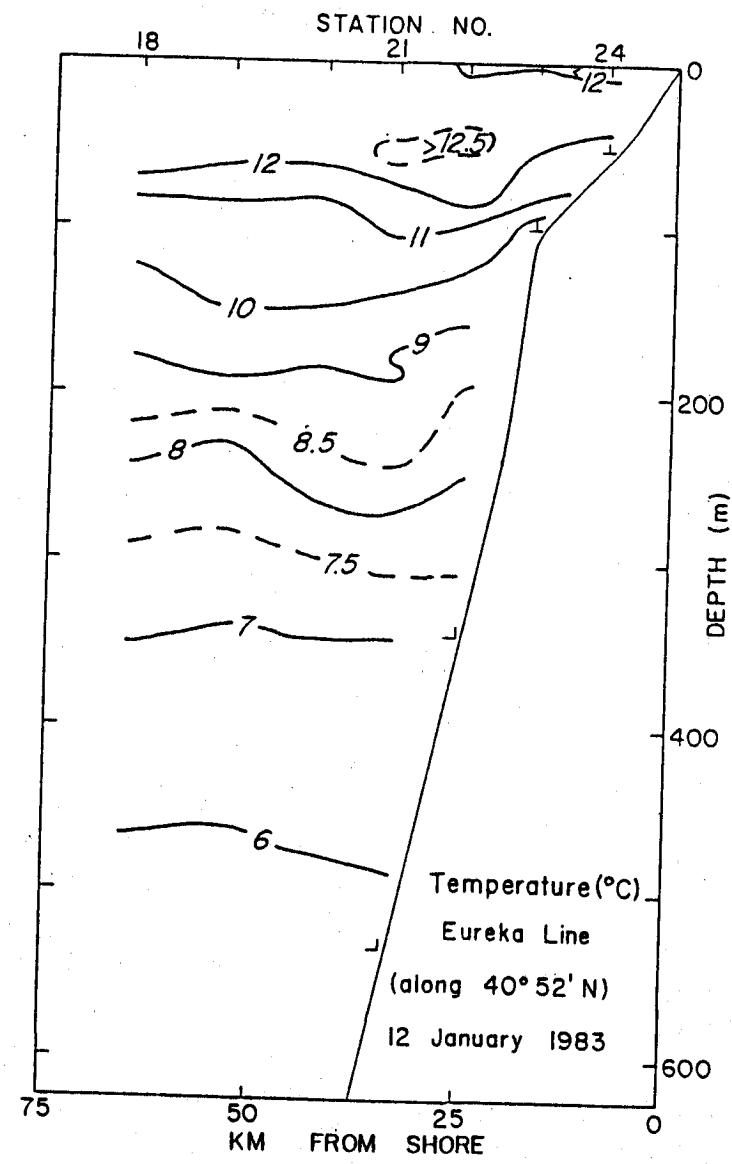

STA NO	Consecutive station number.
STATION	The CTD section name (initialled) and number of the station on the line (Refer to Figures 1 and 2).
LAT	Latitude in degrees and minutes north of the equator.
LONG	Longitude in degrees and minutes west of Greenwich.
DATE	Day/Month/Year.
TIME	Time in Greenwich Mean Time.
PROBE	CTD probe number.
DEPTH	Sonic depth in meters, corrected according to Matthews Tables appearing in the Handbook of Oceanographic Tables. U.S. Naval Oceanographic Office Publication SP-68 (1966).

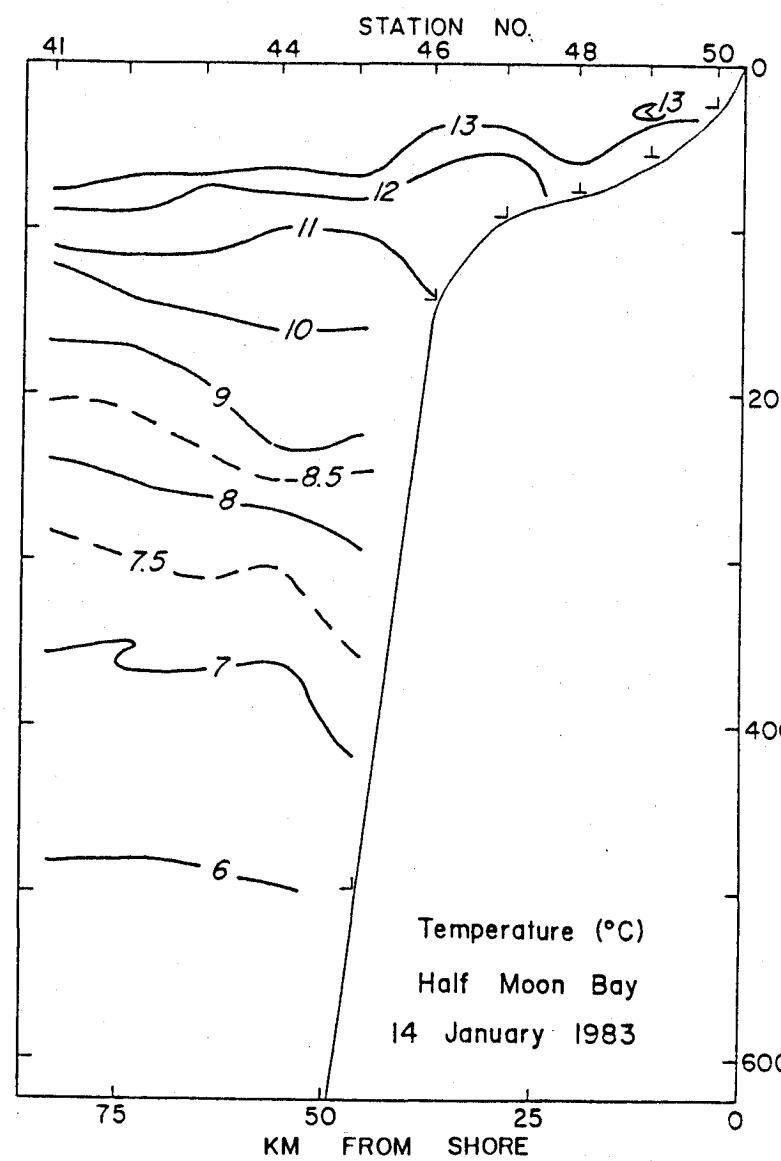

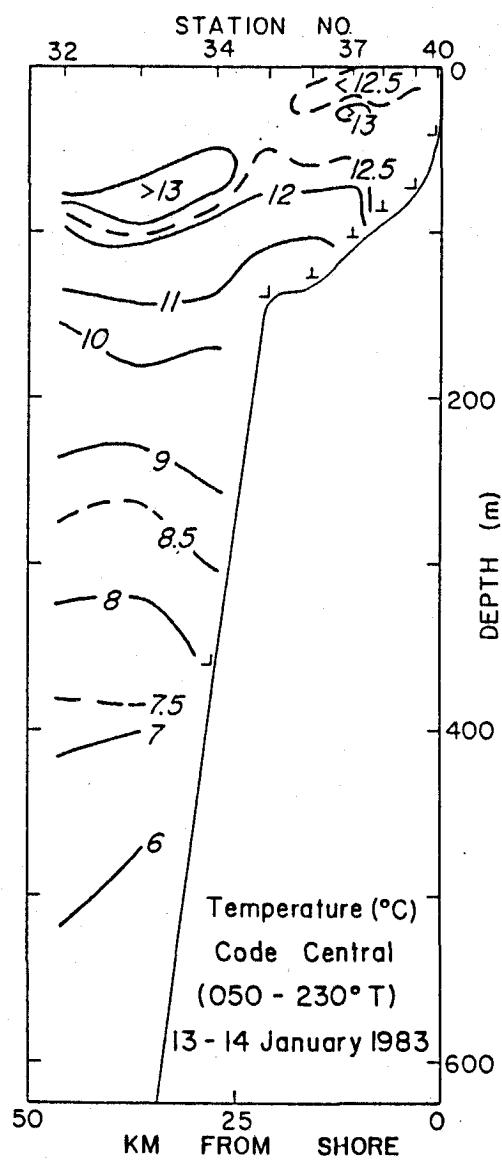

The data listing for each station gives values at standard pressures including observed and calculated parameters at the shallowest and deepest observations levels. Temperature ($^{\circ}\text{C}$) (TEMP), salinity ($^{\circ}/\text{o}$) (SAL), potential temperature ($^{\circ}\text{C}$) (POTEN TEMP), sigma-theta (SIGMA THETA), specific volume anomaly $\times 10^5$ (SVA) and dynamic height (DELD) in dynamic meters are given for each pressure (PRESS) in decibars. Computed parameters are calculated from the complete data array.

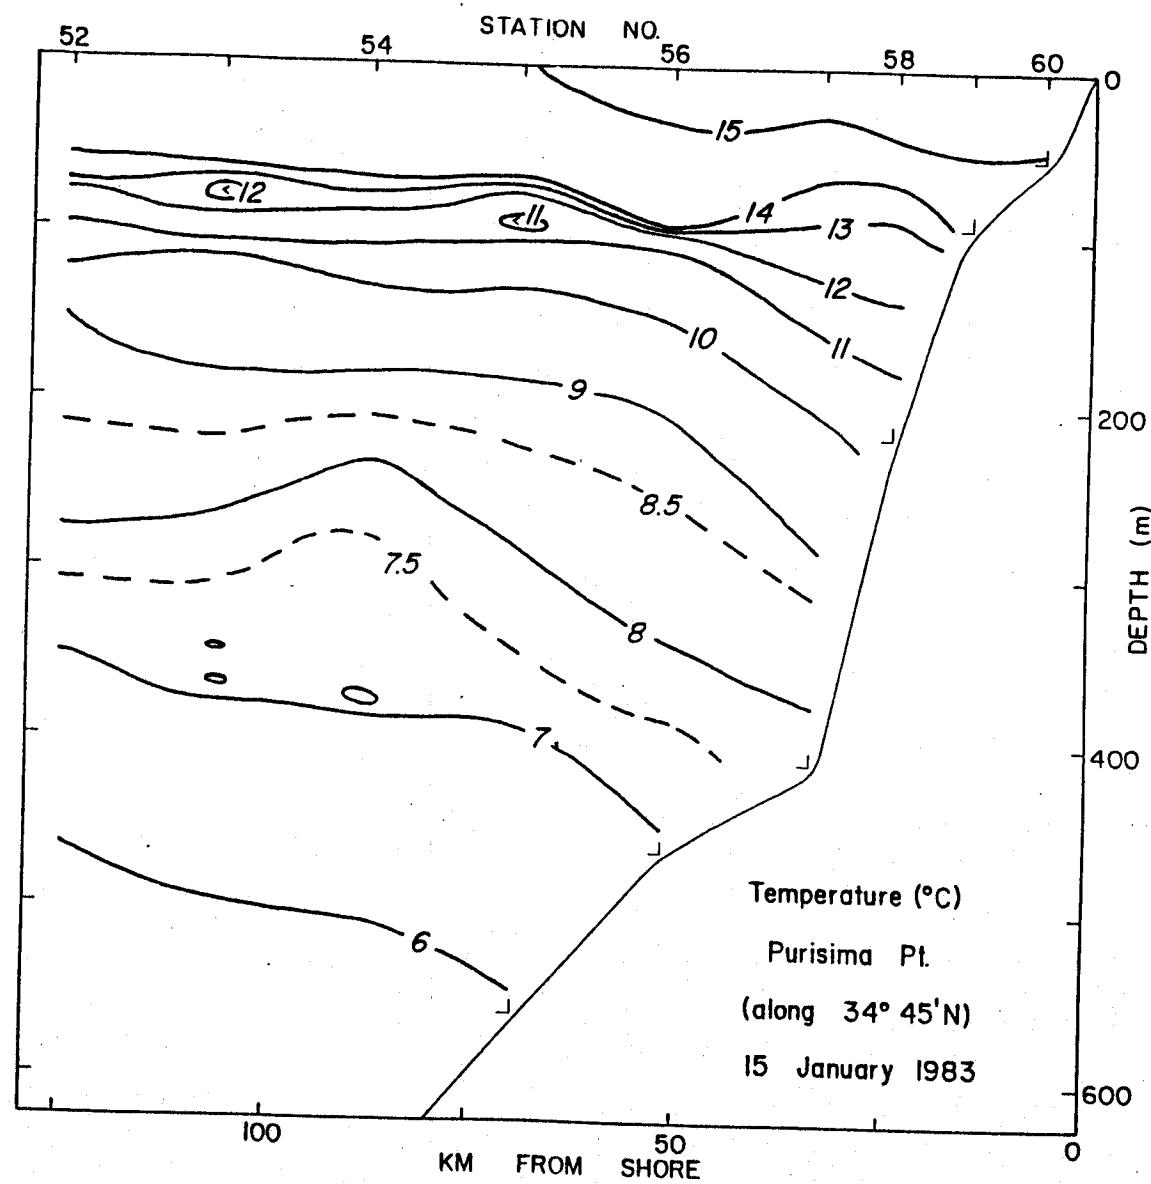

Vertical profiles of dissolved oxygen and transmission are also presented for Stations 1-11, Leg 4. The oxygen values of the calibration samples are represented by a circle on the profiles. The data listings for these stations include dissolved oxygen (ml/l) (O2) and transmission (%) (TRN) values at standard pressures.

ACKNOWLEDGMENTS

These observations of the Large Scale West Coast Shelf Experiment and the Coastal Ocean Dynamics Experiment were supported by the National Science Foundation through Grants OCE-8026131 and OCE-8014943 respectively. Additional support for Leg 5 came from National Science Foundation Grant OCE-8014941 to Woods Hole Oceanographic Institution. Data processing and analysis are supported through NSF Grants OCE-8405232 and OCE-8410861.
