CENPP-PE-HR (1110A)

25 August 1995

MEMORANDUM FOR CHIEF CENPP-PE-P ATTN CHARLES MASON

Subject: Newport North Marina Jetty Sediment Evaluation

1. Enclosed is the sediment evaluation for the Newport North Marina Jetty project. The sediment was evaluated for acceptability of in-water disposal at the offshore ocean disposal site. The evaluation was conducted according to guidelines published in the "Green Book" and "Inland Testing Manual". These guidelines help insure compliance with requirements of the Marine Protection Research and Sanctuaries Act (MPRSA) and the Clean Water Act (CWA) that pertain to sediment toxicity.

2. The evaluation shows that the proposed dredge material is clean sand, free of contaminants, low in organic content, and located in a high energy area of the river. These characteristics qualify the material to meet the exclusionary criteria of both MPRSA (40 CFR PART 227.13) and CWA (40 CFR, PART 230.60) regulations. By meeting the criteria, the dredge material is acceptable for both in-water and upland disposal. No unacceptable, adverse ecological impacts due to toxicity are **expected** from such disposal. State 401 water quality certification should be obtainable as well.

3. If you have questions regarding this sediment evaluation please contact Mr. Jim Britton, CENPP-PE-HR, ext. 6471.

STEVEN L. STOCKTON, P.E.

STEVEN L. STOCKTON, P.E. Chief, Planning and Engineering Division

Newport North Marina Jetty Sediment Evaluation

Abstract

Sediment along the western end of the Newport North Marina Jetty is free of contaminants such as metals, PAHs, pesticides, PCBs, phenols and TBT. According to guidelines developed to implement the CWA and MPRSA, the sediment is acceptable for both in-water and upland disposal.

Introduction

1. The Neport North Marina Jetty is located on the north side of the Yaquina River between river miles 1.5 and 1.8 just opposite the city of Newport. It was constructed to dissipate the energy of incoming waves and offer some protection to boats and moorings facilities located in Newport. Unfortunately, the jetty is under-protecting the area so that modifications are needed to improve its efficiency. Plans call for dredging around the western end of the jetty in conjunction with construction improvements.

2. The Clean Water Act (CWA) and Marine Protection Research and Sanctuaries Act (MPRSA) require that material proposed for dredging be evaluated for the ecological consequences of disposal. This report presents results of physical and chemical analyses of project sediment and evaluates whether any adverse impacts associated with contaminants are expected. Previous studies of local sediment, knowledge of local contaminant sources, and results of the current study are used in the evaluation.

3. Earlier studies in the area show that the sediment near the project is sandy and contains some shell hash (1-5). The area between the jetty and the city of Newport shoreline is progressively more silty proceeding from the jetty to the shore (1). Chemical contaminants increase in concentration along this gradient. However, contaminants are not at levels that restrict in-water disposal. Accross the river, at South Beach Marina, similar silty and contaminant conditions prevail (7). Upriver, in the area of the turning basin of the Federal Channel, the sediment is sandy and typically free of contaminants. The condition of river sediments, further upstream in the main channel, is the same and reflects the low exposure to sources of contaminants (3, 6).

4. Sources of local contaminants are surface runoff from developed areas, boat works facilities, marinas, fish processing plants, lumber and wood manufacturing facilities, and non point sources in the watershed.

5. Even though earlier studies suggest that the project is in a high energy area with sandy material free of contaminants, sediment samples were taken at three locations and subjected to physical and chemical analyses to confirm these expectations. A box corer, which is a surface grab sampler, was used instead of a coring device to sample the sediment because previous experience had shown this area to be a zone with a rather "hard bottomed", sandy substrate containing plenty of shell hash. This is descriptive of substrates that typically fall into the exclusion criteria of the CWA and MPRSA. Recent

cores obtained by the Corps show that the sandy layer is roughly 4 to 20 feet deep and is underlain by siltstone (see appendix showing logs of cores obtained for the Corps by Geotechnical Resources, Inc). This indicates that the same high energy conditions have prevailed here for some time. Therefore, it is unlikely that deeper layers contain contaminated material so that core smpling was not necessary.

Methods

6. Three sediment samples were taken on 15 March 1995, using a Gray O'Hare box corer (0.095 m³), at the west end of the North Marina Jetty located in Newport, Oregon (Figure 1). One sample was taken off the end of the jetty while the other two were taken on either side of the jetty in about 15 feet of water. Experience from previous sediment studies has shown that these samples are representative of the whole project area. All sampling, handling and storing of samples was conducted according to approved procedures outlined in the "Green Book" developed jointly by the EPA and Corps of Engineers (8).

7. Subsamples of each were sent to the U. S. Army Corps of Engineers Materials Laboratory at Troutdale, Oregon where they were analyzed for grain size distribution, volatile solids content, resuspended density, void ratio, specific gravity, soil classification and particle roundness grading. The first two parameters are pertinent to this sediment evaluation while the latter five are useful to dredging coordinators and contractors and so will not be discussed in this report.

8. Subsamples of the three samples were also analyzed for chemical contaminants by Columbia Analytical Associates (CAS), Kelso, Washington. Subsamples were tested for heavy metals, pesticides, PCBs, tributyltins (TBT), polynuclear aromatic hydrocarbons (PAHs), phenols, total organic carbon (TOC), and acid volatile sulfides (AVS).

9. Data from the contaminants analyses were reviewed by the Materials Laboratory and this office for quality assurance. Overall, the project data were considered acceptable. The quality assurance report along with the quality control evaluation, conducted by CAS, is included in the appendix with the raw data.

Results/Discussion

10. The sediment samples were mostly sandy material. Mean sand content was 96.1 %. Mean silt was 3.3%. One sample contained a trace of clay. The sample on the north side of the jetty was more silty than the others (Figure 1, Table 1). The mean organic content, reflected in percent volatile solids, was 1.0 %.

11. Heavy metals were below established concern levels (Table 2). AVS was low as well. AVS can be important in fine grained sediment with a high metals content. In that situation AVS would offer some protection against the toxic effects of metals. Since the sediment samples are low in metals the low AVS is of no consequence.

12. TOC content is a measure of organics in the sediment. Sources of organic material are dead plant and animal matter, microbes, living things and organic chemical

contaminants. The measured values indicate the sediment is very low in organic carbon. Organic contaminants were not detected except for two PAHs that were detected at very low concentrations (Table 3). The low TOC content, combined with low organic contaminants, is another indication of the clean nature of this material.

13. These physical and chemical results are typical of high energy areas in river systems where exposure to contaminants from local and upstream sources is limited. In high energy areas the sedimentary material is usually sandy and free of contaminants. Typically, contaminants, if present, would be associated with the fine grained fraction. As can be seen from the physical results the sediment is very low in fine grained material.

Conclusions

14. This sediment evaluation was conducted following procedures outlined in the Draft Inland Testing Manual, developed to implement section 404 of the Clean Water Act and the "Green Book", developed to implements section 103 of the Marine Protection Research and Sanctuaries Act (8,9). These procedures describe methods for conducting ecological evaluations of dredge material to determine the potential for toxicity.

15. The methods utilize a Tiered Testing Procedure to evaluate dredged material for acceptability of disposal. Tier I allows the material to be evaluated based on existing information. Tiers II through IV require futher testing of the material. An evaluation only needs to procede through the Tiers to a point where a decision can be rendered. In this sediment evaluation only Tier I was needed to come to a conclusion regarding acceptability of disposal. Existing information shows the material to meet the exclusionary criteria of both the MPRSA and CWA. The lack of contamination in the sediment lends credence to this conclusion. In terms of impacts related to contaminants, the sediment alongside the western end of the Newport North Marina Jetty is acceptable for in-water disposal at freshwater or ocean disposal sites and at upland disposal sites according to requirements of the MPRSA and CWA. Non adverse ecological impacts are expected from such disposal.

MEMORANDUM FOR: Commander, Portland District, ATTN: CENPP-PE-HR (Britton)

SUBJECT: W.O. 95-191, Results of Chemical Analysis

Project: <u>Newport North Marina Jetty Sediment/Project</u>
Intended Use: Site Evaluation
Source of Material: <u>Reference Chain of Custody Records</u>
Submitted By: <u>CENPP-PE-HR (Britton)</u>
Date Sampled: <u>15. Mar 95</u> Date Received: <u>22 Mar 95</u>
Reference: a) DD Form 448 MIPR No. E86-95-0066 dated 13 Mar 95
b) Original report number K9501715 from Columbia Analytical Services,
Inc submitted to your office by the laboratory

1. Enclosed are the original Quality Assurance Report, original report number K9501715 from Columbia Analytical Services (CAS) Inc., and original CENPD-ET-P-L sample cooler receipt form, and original chain of custody record for the samples collected from Newport North Marina Jetty Sediment site.

2. EVALUATION OF THE PROJECT LABORATORY'S' RESULTS: All laboratory method blanks were free of targeted analytes. All holding times, detection limits met method requirements. Chain of custody record and sample cooler receipt form met Corps of Engineers ER 1110-1-263 protocols except the sample cooler temperature was 7.6 °C which is above COE required limits of 4 ± 2 °C. All surrogate, matrix spike (MS), matrix spike duplicate (MSD), laboratory control sample (LCS), laboratory control sample duplicate (LCSD) recoveries and relative percent differences (RPD) results were within EPA, Laboratory Established (LE). Quality Control (QC) limits, with the following exceptions; mercury MS recovery was within CAS LE QC limits of [60-130] but above EPA QC limits of [75-125], since no mercury was detected in any sample the high recovery did not affect the results, cadmium duplicate RPD result was above EPA limit, the cadmium data are considered estimates, lead RPD result was not calculable due to the detection at or near the detection limit, which is not considered significant. Overall the project data are acceptable.

3. If you have any questions or comments regarding the Chemical Quality Assurance Report, please contact Dr. Ajmal M. Ilias at (503) 669-0246.

Director U. S. Army Corps of Engineers CENPD Materials Laboratory 1491 NW Graham Avenue Troutdale, OR 97060-9503

Re: Newport North Marina Jetty Sediment/Project #95-0191

Dear Director:

Enclosed are the results of the sample(s) submitted to our laboratory on March 22, 1995. For your reference, these analyses have been assigned our service request number K9501715.

The Electronic Data Deliverable (EDD) will follow shortly.

All analyses were performed consistent with our laboratory's quality assurance program. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the samples analyzed.

Please call if you have any questions. My extension is 281.

Respectfully submitted,

Columbia Analytical Services, Inc.

eyet &

Army Corps of Engineers Cooler Receipt Form

Project: NEWPORT	NORTH MARINA STATA	SEDIMENT
Cooler received on $3/2>$	and opened on 3/22 by	LB

1.	Were custody seals on outside of cooler?	YES NO
	Were signature and date correct?	YES NO
2.	Were custody papers taped to lid inside cooler?	YES NO
3.	Were custody papers properly filled out (ink, signed, etc.)?	YES NO
4.	Did you sign custody papers in the appropriate place?	YES NO
5	Did you attach shipper's packing slip to this form?	YES NO
6.	What kind of packing material was used?	
7.	Was sufficient ice used (if appropriate)?	YES NO
8.	Were all bottles sealed in separate plastic bags	YES NO
9.	Did all bottles arrive in good condition (unbroken)?	YES NO
10.	Were all bottle labels complete (No., date, signed, analysis, pres., etc)?	YES NO
11.	Did ail bottle labels and tags agree with custody papers?	YES NO
12.	Were correct bottles used for the tests indicated?	YES NO
13.	Were VOA vials checked for absence of air bubbles. and noted if so?	YES NO
14.	Was sufficient amount of sample sent in each bottle?	YES NO
15.	Temperature of cooler(s) upon receipt: 7.6°C	
	Identification number of thermometer: # 20	·
	Is the temperature within $4 \pm 2^{\circ}$ C?: Yes \Box Yes \Box Yes \Box Yes \Box No \Box No \Box	Yes 🖸 🦞 Yes 🗆 No 🗆 No 🗔
