

Supplementary figure S4

**Figure S4: Overexpression of RhoA or its mutant did not induce the formation of liver malignancy.** The genotypes of the fish and the treatment dosages of doxycycline were labelled at the top. (A-D) Gross observations of the various fish. (E-H) The fish were dissected to show the size of the livers. The livers were highlighted with the dotted yellow line. There was no obvious enlargement of the liver in transgenic fish compared to the wild-type control. (I-L) H&E staining of the paraffin sections. No significant lesions were observed in the single transgenic fish. Scale bar for A to H is one cm. Scale bar for Figure I to L is 50 µm.
