

## Supplementary material

**Table S1.** Regional evidence of ocean warming and the intrusion/ increased abundance of tropical and warm-temperate herbivores and habitat-forming organisms (coral and macrophytes) into colder temperate regions and reported ecological impacts derived from the tropicalisation of temperate marine ecosystems. + = range expansion, - = range contraction, \* = tropical or subtropical origin, ^ = temperate original distribution. Herbivorous fishes are here considered in a broad sense and include macroalgal browsers, scrapers, excavators, grazers and detritivores. All these functional groups can impact macroalgal abundance, although for some nutrition is derived from detrital or other material associated with the algae [1, 2]. Note that saltmarshes and mangroves are not included in this review.

Region	Oceanography	Changes in distribution			Ecological impacts
		Herbivorous and detritivorous fishes and other herbivores	Habitat-forming macrophytes (macroalgae and seagrasses)	Corals	
Eastern Mediterranean	Regional warming [3, 4]	<b>Rabbitfish (Siganidae)</b> <i>Siganus luridus</i> (*, +) [5-13] <i>Siganus rivulatus</i> (*, +) [8, 11, 13-15]	<b>Seagrass</b> <i>Halophila stipulacea</i> (*, +) [6]	<b>Gorgonian</b> <i>Acabaria erythraea</i> (*, +) [16]  <b>Hermatypic coral</b> <i>Oculina patagonica</i> (*, +) [17, 18]	> Extensive deforestation linked to rabbitfish ( <i>Siganus</i> spp.) expansion, causing loss of benthic biomass and diversity [19, 20]  > Shift from algal to coral dominance linked to <i>O. patagonica</i> expansion [21]
