GENERAL DESCRIPTION^{1/}

Morrow County is located in the northeast portion of the state along the Columbia River. It extends from the Columbia River approximately 60 miles south to the Blue Mountains. It contains 1,321,600 acres of which about 292,000 acres are federally owned and over one million acres are farm land.

The topography varies from gently rolling plains near the Columbia River to broad plateaus and rounded ridges leading to the rugged terrain of the Blue Mountains.

Heppner, the county seat, is located in the center of the county and contains 1,425 people, nearly one-third of the total population of 4,320.

Agriculture is the leading industry in the county while forestry and tourism are also important factors in the county's economy. A long growing season, low elevation, fertile soil, and adequate irrigation water provide a golden opportunity for future agricultural growth in Morrow County. A brief summary of the major facts for the county is noted below.

Area: 2,065 square miles
1,318,592 acres

Population: 4,320
(July 1, 1972)

Elevation at Heppner: 1,955 feet

True Cash Value: \$97,340,843
(Nov. 20, 1970)

Average Temperature:
Summer - 65.1
Winter - 37.1

Principal Industries:
Agriculture, Livestock,
Lumbering, Recreation

County Seat: Heppner

PHYSICAL ASPECTS

Climate

The climate of Morrow County is temperate and semi-arid characterized by low annual precipitation, low winter temperatures, and high summer temperatures. Much of the county is subject to violent convection (cloud-burst) summer storms that cover a small area but are of high intensity. These storms cause severe soil erosion and flood damage and add very little

^{1/} OSU Cooperative Extension, Agriculture in Oregon Counties -- Farm Sales and General Characteristics, Special Report 330, Oregon State University, 1971.

to the soil moisture. Strong winds, generally from the west and southwest, may occur at any time of the year. The winds cause drifting snow in the winter and soil movement and excessive evaporation during other seasons.

Average annual precipitation varies from 26 inches in the upper reaches of the county to 7 inches in the Boardman area along the Columbia River. Annual precipitation in most of the agricultural areas of the basin varies from 8 to 20 inches. Precipitation during the irrigation season, April 1 to September 30, averages less than 6 inches in most agricultural areas.

Soils

Most soils of the basin are derived from transported materials. At the lower elevations on the west the soil material is of glacial origin with areas of medium textured, clacareous sediments and areas of coarse textured sediments. At higher elevations over most of the basin is the Palouse formation of aeolian deposit of white volcanic ash found in small pockets on north exposures and relatively large areas in the Blue Mountains. Alluvial soil material from the uplands is found along the streams. The exceptions are the Blue Mountains and their footslopes which have soils that have partially developed from the underlying rock. The basin is dissected by drainages with south exposures of shallow, stony, residual soils from basalt.

The alluvial soils are on nearly level to gently sloping valley bottoms near the rivers and creeks. They vary in texture from silt loam to sandy loam, sometimes mixed with gravels. Volcanic ash deposits are found in pockets and in horizons in the soils. They vary from neutral to strongly alkaline in reaction and from excessively to poorly drained. The following soils are included: Caldwell, Catherine, Yakima, Onyx, Pedigo, Stanfield, Umapine, and Snow.

These soils are often irrigated and are adapted to a wide variety of crops.

Condon-Walla Walla and Lickskillet soils occur predominately on nearly level to gently sloping upland plateaus and associated steeply sloping canyon walls. Condon and Walla Walla are moderately deep to deep, well drained, grayish brown, medium textured soils. The canyon walls have deep soils on the north exposures and shallow stony soils on the south exposures.

The deep soils of the association are used primarily for wheat production in a wheat-fallow rotation. The remainder of the area is used for range. These soils on favorable slopes are well adapted for irrigation.

Morrow-Bakeoven-Lickskillet soils occur on nearly level to gently sloping upland plateaus and steeply sloping canyon walls. Morrow is a moderately shallow to moderately deep, well drained, grayish brown, medium textured soil. The canyon walls have deep soils on the north exposures and shallow, stony soils on the south exposures.

Morrow soils are used primarily for small grains in a rotation with fallow. The remainder of the area is very well adapted and used for range. The potential for irrigation of these soils is limited because of relatively shallow depth and location.

Quincy-Ephrata soils were developed from the coarse-textured glacial sediments which have been reworked by water and wind. The topography is gently undulating, and dunes are quite common, some of which are still active. These sandy soils are weakly developed, light colored, excessively drained, and neutral to slightly alkaline in reaction. Included in this association are the Quincy, Ephrata, Rupert, and Taunton series.

Winter range for sheep is the principal use of this association. The dominant vegetation is annual grasses and sagebrush. A smaller area is

irrigated, producing forage and other crops. Some of these soils respond well to irrigation while others do not. Good water management is of utmost importance for the entire group.

Ritzville-Starbuck soils were developed from loess. The principal soil is Ritzville, which is a deep, pale brown, well drained, medium textured soil. Starbuck occurs on the south exposures on gently to very steep canyon walls and is shallow and stony.

Most Ritzville soils are used for small grain in a rotation with fallow. Most of the Starbuck and some Ritzville is used for range. Ritzville soils are well adapted for irrigation.

Rockland-Quincy soils occur in the area of coarse-textured glacial sediments that have been severely eroded by water and wind so that basalt has been exposed. Rockland is a miscellaneous land type and is mapped separately as a complex with Quincy and Ephrata. The only agricultural use of this land is range and primarily winter range for sheep. The dominant vegetation is annual grasses and sagebrush.

Sagemoor-Quincy-Taunton soils are formed on the medium-textured glacial sediments. The major soil is Sagemoor which is a well drained, medium textured soil. Quincy, Ephrata, and Taunton are the other soils in this group.

Winter range for sheep is the principal use of these soils with the vegetation being bluebunch wheatgrass, annual grasses, and sagebrush. A small portion of Sagemoor is producing wheat successfully. These soils are reasonably well adapted to irrigation.

Tolo-Klicker soils occur in the high country of the Blue Mountains with nearly level to gently sloping uplands which break off to very steeply sloping canyon walls. Tolo, Couse, and Helmer are deep soils developed primarily from loess and volcanic ash and to a lesser extent the underlying rock. Klicker and Kilmerque are moderately deep soils developed from the underlying rock and to a lesser extent from aeolian sediments. Rock Creek and Snipe are shallow to very shallow, very stony soils developed from the underlying rock.

Most of these soils support a forest or mixed forest-grass type vegetation which is used for summer grazing of livestock. Minor areas of all the deep soils are cultivated and produce small grain, legumes and grass, and berries. The shallow, stony soils are used for range.

Waha-Snipe soils are found on the footslope of the Blue Mountains on nearly level to very steep slopes. On the east portion of the basin the Waha, Couse, and Palouse series occur in almost equal parts with a minor area of shallow stony soils. On the south and west portion approximately half of the area is composed of the Waha and Hurwall series with the remainder being shallow stony Snipe soils.

These soils are used mostly for relatively high producing range. The major vegetation is Idaho fescue, bluebunch wheatgrass, and shrubs.

Soil Characteristics and Land Capability

There is a constant need for information on conservation needs that will aid in carrying out a conservation program. There is also a need for a systematic collection of facts regarding soil and water resources, the problems in their use, and an estimate of the acres needing treatment. The need for these facts resulted in an inventory by the Oregon Conservation Needs Committee assembling such facts--"Oregon Soil and Water Conservation Needs Inventory", Oregon Conservation Needs Committee, September, 1967.

The acreage covered by the inventory included about 48 percent of the total land area in Oregon by county. Most of the excluded area was federally owned land on which conservation programs were already in progress.

The inventory was developed from basic data regarding: (1) present acreage in major uses and (2) acreage of each land use classified by physical problems affecting its use. The estimates of needs for conservation treatment, for each major land use, were based on acreages expected for 1975 and the condition of the land or of the vegetation cover as of January 1, 1967.

Oregon's land varies widely in capability for agricultural use. Eight land capability classes express the range of suitability for cultivation and other uses and the need for conservation treatment. The subclasses indicate the major reason for limitation. The capability classes are designated by Roman numerals I through VIII. They indicate progressively greater limitations and narrower choices for practical use. In subclassification "E" indicates erosion, "W" indicates excessive water, "S" indicates shallowness or stoniness, and "C" indicates climate that is too cold or too dry.

The second table following shows land use by these capability classes.

Land Ownership

Publically owned land in Morrow County constitutes 44.3% of the land area. Of this, 7.3% is state owned, 37% is federally owned, with the remaining land in city streets. The major holders of public land in the county are the Veterans Administration and the U.S. Forest Service. The following tables give information on state and federally owned lands.

Land Use

Land use in Morrow County is devoted primarily to agriculture and forest. The county is almost totally rural, with only 1,292 of the county's 1,318,592 acres classified as urban. Much of the county's agricultural area is poor farm land and is used only for grazing. The following tables are land use analyses of Morrow County.

Agricultural Land

About 75% of the land in Morrow County is in farms. Of this land, almost 20% is harvested cropland. Over half of the cropland is designated "other land" in the table below. Much of this land is used for grazing in Morrow County.

Table 13. Land in Farms, Morrow County, 1964 and 1969

Water

Most of the water control facilities in Morrow County are for irrigation and flood control. According to the state engineer, there are plans for improving the Butter Creek Watershed. This includes 231,000 acres in Umatilla and Morrow Counties. The primary problem is flooding of agricultural land and lack of late seasonal irrigation water. Presently, there are 2,170 acres irrigated with a possibility of an additional 6,200 acres.

The following tables give the discharge of the major creeks and streams in Morrow County and the dam and reservoir sites on those water flow areas.

Table 14. Surface Discharge in CFS and Acre-Feet,
Morrow County, Water Year 1968^{1/}

Station	Drainage Area sq. mi.	Total	Mean	Max.	Ac.-Ft.
Butter Creek near Pine City	291	2,280.	6.23	83	4,520
Willow Creek at Heppner	87	946.55	2.59	22	1,880
Rhea Creek near Heppner	120	1,330.99	3.64	23	2,640
Willow Creek near Arlington	850	132.44	.36	2.9	263

^{1/} Cubic foot-per-second (cfs) is the rate of discharge of a stream whose channel is 1 sq. foot in cross sectional area and whose average velocity is 1 foot per second.

Acre-foot (ac.-ft.) is the quantity of water required to cover an acre to the depth of 1 foot and is equivalent to 43,560 cubic feet.

SOURCE: U.S. Department of the Interior Geological Survey in cooperation with the state engineer, Water Resources Data for Oregon, Surface Water Records.

Morrow County has two treatment plants for sewage that enter water systems in the county. The first is at Heppner and empties into Willow Creek. The other is located on a lagoon near the Columbia River. This sewage receives secondary treatment before being emptied into the Columbia.

There is only one industrial waste treatment plant in the county. It is located at Heppner at the plywood-veneer plant. The treatment facility consists of a non-overflow evaporative pond.

The other cities in the county have no sewage disposal or treatment plants.

Minerals

Because of limited mineral resources that are mined commercially in Morrow County, the U.S. Bureau of Mines withholds figures on value of mineral production to avoid disclosing confidential data of individual companies. However, the U.S. Bureau of Mines Minerals Yearbook gives some information on the county combined with other counties.

Wildlife

Morrow County has numerous species of wildlife, but deer and elk seem to be the most numerous and the ones that draw most people to the county for recreation. In 1970, 10,440 hunters took advantage of Morrow County's deer hunting opportunities. There were also many elk hunters and small game and fowl hunters. The following tables give information on the harvest of animals and on herd composition and population.

HUMAN RESOURCES

Population

Morrow County is very sparsely populated with only 2.01 persons per square mile. Although most of the county is made up of rural farmland, almost all of the people live in or near one of the cities in the county, with one-third of the population centered around the county seat of Heppner.

Employment

There were 1,775 people in the labor force in Morrow County in 1970. Of these, 1,626 were employed. The greatest percentage of workers were employed in agriculture or related fields. Most of the unemployed were either craftsmen or operatives of some type. The 123 persons unemployed constitute 7.3% of the labor force, with Morrow County ranking twentieth out of the 36 counties for unemployment.

The following tables give data on types of employment, composition of labor force and unemployment.

SOURCE: Oregon Board of Higher Education, 1970-1971 Oregon School Directory, School Finance & Statistical Services.

Morrow School District #1 is a unified "A" district according to the State Board of Education. This means that it provides education for grades 1 through 12 and is an administrative school district organized under the provisions of ORS 330.505 to 330.780.

The ADM as seen on the table above designates the average daily membership. This is computed by dividing the sum of total days present and absent by the number of days actually taught.

Health and Vital Statistics

The only licensed health care facilities in Morrow County are located in Heppner, the largest town in the county. They include one hospital and one nursing home facility that is affiliated with the hospital. The total capacity for patient care is 44.

The following tables give data on health care facilities and medical personnel. In Table 46, the ratio figure equals population per professional in each particular category.

Table 46. Number of Licensed Medical Personnel and Ratio to Population Morrow County, 1969

Profession	Number	Ratio

The next tables give data on major uses of health facilities. This includes births, deaths, and major illnesses. According to District Facts, published by the State of Oregon Executive Department, 10 in every 100 persons in Morrow County made visits to the one diagnostic and treatment center in the county, which is located in Heppner.

THE COUNTY'S ECONOMY

Morrow County is mostly rural. As a result, most of the county's economy is centered in agricultural and forest related industries and occupations.

The tables in this section are designed to give a perspective of the economy as divided into its major factors: agriculture, logging and wood products, manufacturing and trade and service sectors. There is little data on mining or outdoor recreation as these items are not too important in Morrow County, with the exception of hunting.

Agriculture

Logging and Wood Products

Morrow County has four manufacturing operations either directly or indirectly related to the lumber industry. These include a logging contractor, two sawmills and lumber companies, and a box manufacturer. The industry employs an average of 140 people.

The following tables give data on timber harvest, log consumption, and installed 8-hour capacity of mills.

Although there is no bus service to Heppner, Greyhound Bus Lines operates bus service at Boardman. There are five arrivals from Portland daily with two continuing east through Pendleton and Salt Lake City. The other buses continue northward through Yakima and Spokane, Washington. Buses also leave Heppner four times daily for Portland.

Communications

The county is served by the Eastern Oregon Telephone Company with an exchange at Boardman. Morrow County also has a newspaper, which is located at Heppner.
