Dodder

Scientific name: Cuscuta sp.
Common names: Love vine, strangleweed, devil's hair

By Martin Zimmerman, Sherman County Extension Agent, Oregon State University

Annual

Dodder is a leafless parasite, deriving nourishment from host plants. Shown here attacking alfalfa.

Stems golden yellow or slightly reddish

Seeds small; resemble alfalfa

Flowers bright yellow, in small, dense clusters

Ten or more species of dodder occur in this area, all of them parasites with varied hosts. Cuscuta campestris, shown above, is found largely in alfalfa and clovers. Dodder is also found in yards and home gardens.

Control: In alfalfa, apply 6 pounds per acre of granular IPC before dodder becomes attached to host plant.

Spot spraying with Dinitro and oil is effective. Propane burning after first cutting is effective in home gardens; destroy affected plants.

This is one of a series of Fact Sheets reporting Cooperative Extension work in agriculture and home economics, F. E. Price, director. Printed and distributed in furtherance of Acts of Congress of May 8 and June 30, 1914. Oregon State University, Oregon counties, and U. S. Department of Agriculture cooperating.
