

PRELIMINARY CRUISE REPORT, W0101C  
R/V WECOMA, 27-28 January 2001  
GLOBEC Long-Term Observations off Oregon

Submitted by Jane Fleischbein  
College of Oceanic & Atmospheric Sciences  
Oregon State University  
Corvallis, Oregon 97331-5503  
flei@oce.orst.edu, 541.737.5698

FILING DATE: 20 February 2001

CONTRACT/GRANT NUMBER: NOAA Award NA86OP0589 and NA67RJ0151, and NSF Grants OCE-9732386 and OCE-0000733.

PRINCIPAL INVESTIGATOR(S): GLOBEC: Adriana Huyer, Robert L. Smith, P. Michael Kosro, P. A. Wheeler, W. T. Peterson, Jack A. Barth, Barry Sherr, Evelyn Sherr

PURPOSE: To determine physical, plankton and nutrient/chemical conditions over the continental margin for climate change studies in NE Pacific. In particular, to make CTD and CTD/rosette and net tow stations along the Newport Hydro line, to make continuous bio-acoustic observations between the 50-500m. isobath, and to make continuous observations of currents using ADCP and of surface-layer temperature, salinity and fluorescence by means of ship's thru-flo system. Figure 1 shows the location of the CTD stations. Table 1 shows the CTD station positions, and Table 2 shows the biochemical sampling depths.

SAMPLING PLAN:

1. Use ship's intake continuously for Temperature, Salinity, and Fluorescence
2. Continuous ADCP Profiling (150 kHz transducer) for water velocity and backscattering for bio-acoustics.
3. Standard CTD Stations using SBE 9/11 plus CTD system for Temperature, Salinity, Fluorescence, Light Transmission, Oxygen, PAR.
4. Rosette sampling: 5 liter bottles for nutrients, chlorophyll, and microzooplankton.
5. Vertical net tows: 1/2 meter nets 100 m to surface; Horizontal net tows with 1 m<sup>2</sup> MOCNESS.
6. Continuous bio-acoustic observations between the 50-500m isobath along 5 sections using a Hydroacoustics Technology, Inc., system towed alongside the ship.

CRUISE NARRATIVE

A brief overview of the cruise is presented here. An event log is provided in Table 3, and the participating personnel are listed in Table 4. Wecoma departed Newport at 1015 PST on 27 January 2001. CTD sampling started at NH-1. At NH-3, the HTI (bio-acoustic system) was deployed, and MOCNESS tows were started. The winds stayed under 15 kts., and the seas remained calm for most of the Newport line, allowing all of the sampling to occur as scheduled. After completing 12 CTD's and net tows along the Newport Line at 1245 PST, 28 January, we began the transit to Newport. We arrived alongside the pier at Newport at 2100 PST on 28 January 2001.

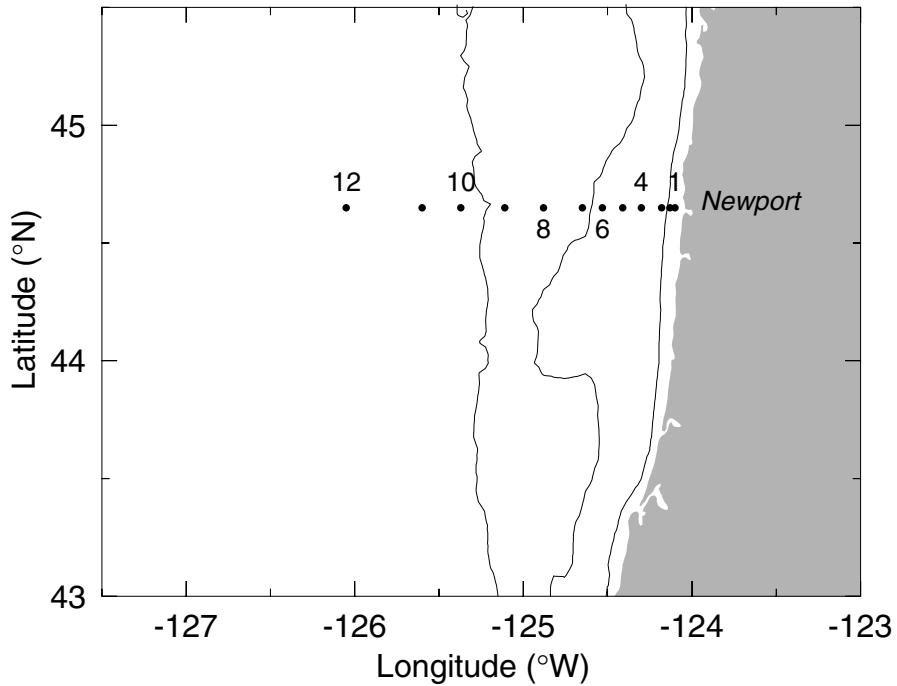

Figure 1. Location of CTD stations during W0101C.

## PRELIMINARY RESULTS

Vertical sections of the parameters measured by the SBE CTD system (temperature, salinity, density, fluorescence voltage, percent light transmission and dissolved oxygen concentration) are presented at the end of this report. These parameters were also measured on an immediately preceding cruise (J. A. Barth, chief scientist), and these partial sections of the NH-line are shown for comparison. Also included is a vertical section of the alongshore currents measured by the shipborne Acoustic Doppler Current Profiler (ADCP).

Winds during most of the cruise were moderate (< 15kts.) and out of the NW or NE until station 9 at NH-45. As a low pressure system approached, the winds shifted around to the SE and steadily increased to 22 kts. at the final station at NH-85. The winds continued to increase quickly, and the steepening wave height made the ride back to Newport very uncomfortable.

The below normal rainfall and absence of winter storms during January were reflected in the relatively high salinity ( $>32.4$ ) and density ( $>25 \text{ kg/m}^3$ ) over the inner shelf, compared to February 2000 when salinity was 31.8 - 32.4 and density was 24.2 - 25  $\text{kg/m}^3$ . The ADCP section shows weak poleward flow over the outer shelf and slope, which is consistent with the north winds that blew before and during much of the cruise. The ADCP section also shows a weak equatorward undercurrent offshore between NH-45 and NH-55.

The attached zooplankton report was provided by Dr. Wm. Peterson.

Table 1. CTD station positions during W0101C, and sampling at each station (C: Bio/Chem bottle sampling, N:half-meter vertical net tows, M:Mocness, P:Pigment, O:Oxygen samples).

Station		Distance from shore	Lat. °N	Long. °W	Bottom Depth	Cast Depth	Sampling Type
Name	No.						
NH-1	1	3.0	44.65	-124.10	29	24	N
NH-3	2	5.4	44.65	-124.13	49	42	P

## Zooplankton Report

### MOCNESS DESCRIPTIONS

NH 5            1350 h            water depth = 60 m

20-50 m        Pleurobrachia, amphipods, pteropods  
10-20 m        pteropods, Pleurobrachia, copepods, 1 amphipod  
0-10 m        pteropods, Pleurobrachia, copepods, 1 amphipod

NH 15            1730 h            water depth = 91 m

50-80 m        greenish goo  
20-50 m        couple of jellies, stringy gelatinous stuff, a few pteropods + copepods  
10-20 m        pteropods, greenish gooey foam  
0-10 m        15 cm "yellow" medusa

NH 25            2040 h (NIGHT)        water depth = 298 m

250-285 m      siphonophores  
200-250 m      30 euphausiids, 1 Sergestes, a 3 cm shrimp, 200 S. scrippsae, 1 big ctenophore  
195-200 m      siphonophores, 50 euphausiids, circle salps (aborted due to winch problems)  
150-200 m      200 adult euphausiids, S. scrippsae  
100-150 m      150 adult euphausiids, 1 squid, radiolaria  
50-100 m       1000 euphausiids  
20-50 m        2000 euphausiids, Corolla, pteropods, small copepods  
10-20 m        1000 euphausiids, Corolla, copepods  
0-10 m        1000 euphausiids, 1 12" diameter Aurelia (discarded), pteropods, 10 Corolla

NH 35            0015 (NIGHT)        water depth 463 m

300-350 m      chaetognaths, 3 myctophids, 1 large mesopelagic fish, siphonophores, copepods, green goo  
200-300 m      chaetognaths, radiolaria, 4 shrimp, 1 myctophid, amphipods  
150-190 m      circle salps, radiolaria, 4 shrimp, 1 myctophid  
100-150 m      circle salps, 30 euphausiids, 3 shrimp  
50-100 m       radiolaria, 2 myctophids, 100 euphausiids, 10 shrimp, 1 Corolla  
20-50 m        4 myctophids, 200 euphausiids, 7 shrimp  
10-20 m        2000 young euphausiids (at least two species)  
0-10 m        9 Corolla, 500 well-fed euphausiids (both E.pac. and T.spin.)

NH 45            0245 (NIGHT)        water depth 664 m

300-350 m	3 Atolla, siphonophores, chaetognaths, amphipods, Pleurobrachia, 1 silver dollar, some copepods
200-300 m	1 Gnathophausia, 100 chaetognaths (scrippsae), siphonophores, circle salps, 10 euphausiids
150-200 m	circle salps, juv. Rockfish, radiolaria
100-150 m	2 myctophids, 30 juv. Euphausiids, 4 Sergestes
50-100 m	300 euphausiids, radiolaria, 1 myctophid, 6 Sergestes
20-50 m	2000 euphausiids, 6 myctophids, 10 Sergestes,
10-20 m	1000's of euphausiids, 1 myctophid, 1 Corolla, a few shrimp
0-10 m	1000 small euphausiids, 5 salps, 2 Corolla,

#### OTHER SAMPLING

Vertical tows from 100 m to the surface were completed at NH 1, 5, 10, 15, 20, 25, 35, 45 and 65.

Copepods were incubated for egg production measurements at NH 5. Six bottles were set-up with adult female *Calanus marshallae* and *Pseudocalanus mimus*

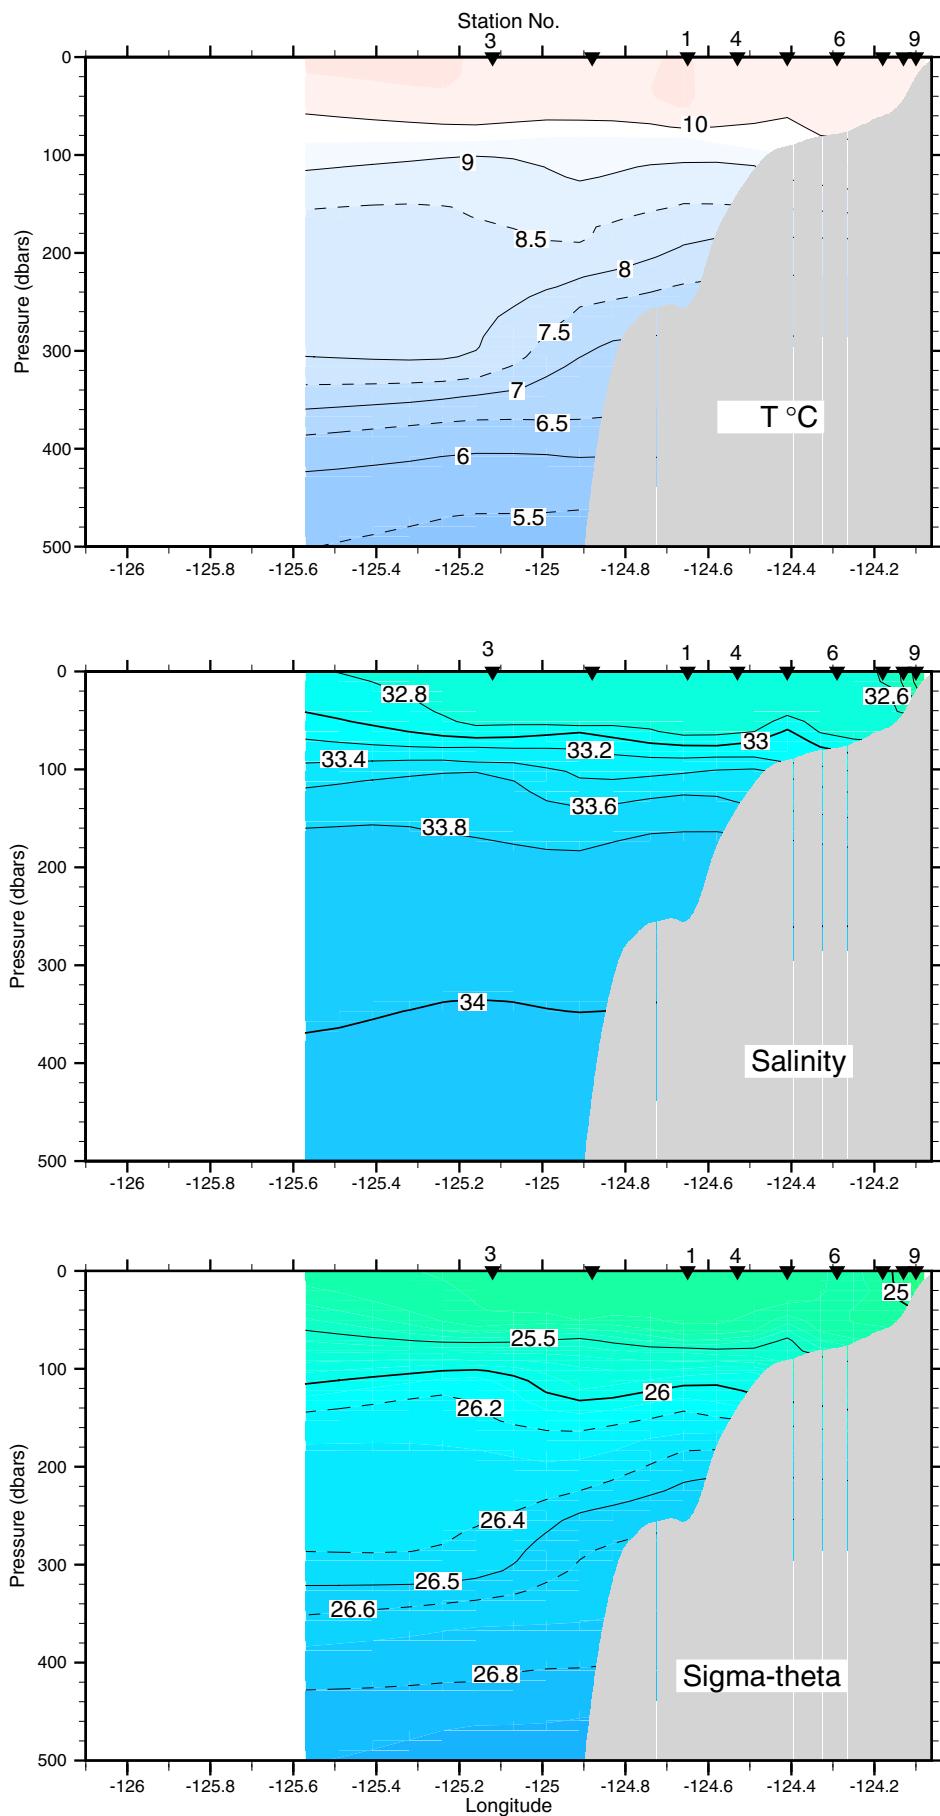

#### MISCELLANEOUS OBSERVATIONS

Secchi depths at stations 5 and 10 were greater than 16 m (we only have 16 m of line).

Large numbers of fulmars were seen at NH 35 and 45. Apart from that, only gulls were common.
