

floors, insulated walls and ceilings, metal siding, and a concrete footing around the perimeter.

Ventilation in these buildings is accomplished either by

- natural air currents that use large windows with curtains, circulating fans, and roof vents, or
- large fans that move a great deal of air to develop static pressure in the house.

Whichever method is used, it must be designed to maintain the proper environment in the house. Completely automated systems are available that keep the house environment at or near the ideal level, but they can be costly.

The broiler production facility also requires a source of heat. Several choices are available, using either gas or electricity. Propane gas is most commonly used for heating in Oregon.

Heater or brooder types include hovers, radiant heaters, and space heaters. Most new facilities use warm-room brooding instead of hovers that heat only the area near the floor where the birds gather.

Feed and water are delivered to the birds by automated systems. Many types are available from several manufacturers. Feed can be delivered by pans or troughs, and water can be supplied by trough, cup, or nipple.

In any case, to determine your equipment type, design, and quantity, you must consider the size of your building, the number of birds you'll grow, and your integrator's management specifications.

Contracts

Oregon broiler growers are under contract to one of three integrators (see the righthand column). Contracts provide advantages to both growers and integrators:

- Integrators don't have to own numerous farms, and they employ only the people who run *their* farms—but they can count on a certain amount of production at an agreed-on price.
- Growers have the security of not having to sell animals on the open market, and they have the backing of a large company—but they're still in business for themselves.

Under most contracts, the integrator provides to the grower the birds, the feed, any needed medications, and technical advice. In addition, the grower doesn't have to pay the costs to deliver chicks and feed or to ship the birds to market.

The grower is responsible for providing the growing environment, litter, utilities, and labor. Overall, the grower supplies between 10 and 15% of the cost of producing the birds, and the remainder is borne by the integrator.

Grower payment depends on the contract, which may vary from integrator to integrator and from time to time. In general, growers are paid by the weight of birds produced, the number of birds produced, or the amount of space in the chicken house.

Payment may be:

- guaranteed,
- based on growth and feed conversion, or
- tied to current market prices in the Northwest or in the Southern States.

An integrator may base payment on your production skills compared to other growers producing for him or her. In some instances, premiums are paid to the top growers based on body weight, feed conversion, and carcass grade.

Discuss your contract with your integrator, in detail, before you reach any agreement.

Organizations

Oregon Fryer Commission is an agency of the Oregon Department of Agriculture; its purposes are promotion, education, market expansion, and research for the broiler industry. Commissioners are growers, elected from among their own ranks. The commission is financed through a mandatory 0.25 cent per pound assessment on all Oregon-grown broilers.

The commission also oversees a labeling law that requires all fryers sold in Oregon to be labeled with the State in which they're grown.

Oregon Broiler Growers Association is a statewide organization that runs solely on the dedication of its members. It's a nonprofit group that uses its finances from dues and promotions to support broiler research and scholarship at Oregon State University and other worthy causes, including 4-H.

The membership is divided into three chapters (South Willamette, Mid-Willamette, and Clackamas); these have

regional grower representation, and they correspond to the three districts of the Oregon Fryer Commission.
