PREFACE

This publication summarizes the results of a 1957 and 1958 reinventory of the forests of Umatilla and Union Counties, Oreg. The reinventory is a part of the maintenance phase of the Forest Survey, a nationwide project of the Forest Service authorized by the McSweeney-McNary Forest Research Act of 1928, amended June 25, 1949. The purpose of the Forest Survey is to periodically inventory the extent and condition of forest lands and the timber and other products on them to ascertain rates of forest growth and depletion, to estimate present consumption of timber products and determine probable future trends in timber requirements, to analyze and make available survey information needed in the formulation of forest policies and programs, and to make resurveys as necessary to keep the basic information up to date.

The Forest Survey is conducted in the various forest regions of the Nation by the regional experiment stations of the Forest Service. In the Pacific Northwest region of Oregon and Washington, it is an activity of the Pacific Northwest Forest and Range Experiment Station at Portland, Oreg.

The initial inventory of forest lands in Umatilla and Union Counties took place in 1936. In 1937 the inventory data were adjusted to current conditions, and the next year the Station released forest type maps of both counties (1-inch-to-the-mile scale) and separate statistical reports, "Forest Statistics for Umatilla County, Oregon" and "Forest Statistics for Union County, Oregon."

Following the reinventory in 1957-58, the forest type maps have again been revised and are available on scales of 1 and 2 inches to the mile. A single 1-inch-scale map was prepared for each county; the 2-inch-scale maps were prepared in sections (see index map, inside rear cover). Any of these maps may be obtained at cost of blueprinting. For information write Director, Pacific Northwest Forest and Range Experiment Station, P.O. Box 4059, Portland 8, Oreg.

GENERALIZED FOREST TYPE MAP
UMATILLA AND UNION COUNTIES, OREGON - 1958

DESCRIPTION OF THE COUNTIES

Umatilla and Union Counties are situated in northeastern Oregon. Umatilla County extends 70 miles south from the Oregon-Washington boundary and 25 to 65 miles west from the crest of the Blue Mountains. Union County, lying immediately to the east, extends from Grant and Baker Counties 60 miles northward to within 1.0 miles of the Oregon-Washington boundary. The Minam River and a spur of the Wallowa Mountains outline the east boundary and separate Union from Wallowa County.

Umatilla County is drained by the Umatilla, Walla Walla, and John Day Rivers. In Union County, 85 percent of the land lies in the Grande Ronde River watershed; the southernmost 15 percent is drained by tributaries of the Powder River.

The topography of the two-county area is varied, ranging from the level plains of northwestern Umatilla County to the rugged Wallowa Mountains of eastern Union County. Between these extremes lie the less rugged Blue Mountains, found in both counties, and the 2,800-foot-high upland plateau of central Union County. Elevations range from 300 feet in the lowlands of northwestern Umatilla County to 9,675 feet at the summit of Eagle Cap in the Wallowa Mountains. The crest of the Blue Mountains averages about 5,000 feet in elevation.

Climate in the two-county area varies with elevation; the lower areas are warmer and drier than the mountainous sections. Annual rainfall ranges from less than 10 inches in the Columbia River valley to more than 30 inches in the higher mountains. Seasonal temperature fluctuates greatly, with temperatures ranging from subzero to more than 100 degrees.

Federal Highways 30, 395, and 730, together with State, county, and Forest Service roads, provide easy access to most areas in the two counties. The main line and branch lines of the Union Pacific Railroad service the more heavily populated parts of both counties.

The population of Umatilla County was at 41,703 in 1950, with 28 percent living in Pendleton, its largest city. Union County had 17,962 persons, with 48 percent living in La Grande.

SIGNIFICANT FINDINGS IN THE FOREST INVENTORY

Land Classification

Slightly more than a quarter of Umatilla County (589,000 acres) and almost two-thirds of Union County (822,000 acres) is forest land. Farmlands and urban areas account for almost all of the remaining area.

Only about 2 percent of the total area of the two counties is noncommercial forest land. Three-fourths of this is unproductive, consisting of noncommercial-rocky, subalpine, and juniper areas. The remainder is classified as productive-reserved land. Several State parks and the Eagle Cap Wilderness Area, all set aside for recreational purposes, account for the productive-reserved land.

Commercial Forest Land Area

Major Types

The forests of the two counties are almost exclusively softwoods, with small stringers of hardwoods in the river valleys. Ponderosa pine predominates in the forested areas and often occurs in pure stands at lower elevations.

$\frac{1}{/}$ Less than 0.5 percent.

As elevation increases, other species--Douglas-fir, white fir, western larch, and lodgepole pine--are found in increasing proportions. On the cool, moist, upper slopes, these species give way to subalpine fir and Engelmann spruce. Extensive pure stands of lodgepole pine are often found at higher elevations where fire, insects, or disease killed the original stand.

Stand-Size Classes

Sawtimber stands occupy slightly more than three-quarters of the commercial forest land of both counties. Large sawtimber (21.0 inches d.b.h. and larger) stands make up slightly less than half of this. A third of the sawtimber area is in ponderosa pine types, and most of the remaining acreage is divided between Douglas-fir, true firs, spruce, and western larch.

Poletimber stands occupy about one-fifth of the commercial forest land in both counties. Repeated fires have aided in establishment of the lodgepole pine stands that now occupy 38 percent of the two counties' poletimber acreage. An additional 30 percent, mostly cutover lands, are stocked with ponderosa pine. Douglas-fir, western larch, and fir-spruce account for most of the remaining poletimber acreage.

Seedling and sapling stands occupy only about 2 percent of the commercial forest land in the two counties. About 1 percent is nonstocked.

Stocking of Young-Growth Stands

Most of the young-growth stands in the two counties are satisfactorily stocked (40-100 percent stocked); only 8 percent are poorly stocked. (Young-growth stands are those in which the majority of the cubic-foot volume is in trees less than 21.0 inches d.b.h.)

Poorly stocked young-growth stands and nonstocked areas comprise 6 percent of the total commercial forest land in the two counties.

Commercial Forest Land Timber Volumes

The net volume of live, sound sawtimber trees (11.0 inches d.b.h. and larger) on commercial forest land in Umatilla and Union Counties is estimated to be 10,464 million board feet, Scribner rule. Nearly all this volume is in sawtimber stands, with only 2 percent in sawtimber-size trees in poletimber and seedling and sapling stands and nonstocked areas.

Volume of Sawtimber by Species

More than 99 percent of the live sawtimber volume in the two counties is in softwoods. Ponderosa pine, Douglas-fir, and white fir together account for almost three-quarters of the total sawtimber volume. An additional one-fifth is in western larch and Engelmann spruce. The remaining volume is distributed mainly among the following species: lodgepole pine, subalpine fir, western white pine, whitebark pine, mountain hemlock, black cottonwood, northwestern paper birch, and quaking aspen.

^{1/} Less than 0.5 percent.

Volume of Sawtimber by Diameter Classes

Four-fifths of the sawtimber volume in Umatilla and Union Counties occurs in trees between 11.0 and 30.9 inches d.b.h., with almost one-half of this in trees over 20.9 inches.

Ponderosa pine and white fir are more commonly found in the larger diameter classes than other species. Sixty-four percent of the volume of these two species is in trees over 20.9 inches d.b.h. Only 47 percent of the volume of the other species in the two counties falls in this size class.

Volume of Growing Stock by Species

Growing-stock volume is the cubic-foot volume of all live, sound trees 5.0 inches d.b.h. and larger to a minimum 4-inch top inside bark.

1/ Less than 0.5 percent.

Of the growing stock in the two counties, 74 percent is in saw-timber trees and 26 percent in poletimber trees.

Forest Ownership

Commercial Forest Land

Thirty-seven percent of the commercial forest land of both counties is in private ownership, and less than 1 percent is divided between State, county, and municipal holdings. The remainder, amounting to about 62 percent of the total commercial forest land, is federally owned or administered.

All but 4 percent of the Federal area is in the Umatilla and Wallowa-Whitman National Forests; the other Federal lands are administered by the Bureau of Indian Affairs and the Bureau of Land Management.

Sawtimber Volume

Approximately three-quarters of the total sawtimber volume is federally owned. Most of the remaining sawtimber volume is on private lands, with only three-tenths of 1 percent on State, county, and municipal lands.

Log Production

In 1958, total log production in Umatilla and Union Counties was 191 million board feet, Scribner rule. During the past 10 years, annual log production has ranged from 33 million board feet in 1949 to 203 million in 1957. Log production for these years was as follows:^{1/}

	<u>Umatilla County</u> (M b.m.)	<u>Union County</u> (M b.m.)
1949	10,553	22,919
1950	53,566	39,365
1951	60,910	38,005
1952	40,533	48,548
1953	63,571	48,273
1954	101,868	64,925
1955	78,653	58,107
1956	78,026	89,228
1957	82,026	120,638
1958	92,494	98,479

The marked increase in production during the past 10 years is a result of the stepped-up timber harvesting program on both national-forest and private lands. The national forests' share of the two counties' log production ranged from 6 percent in 1953 to 31 percent in 1958.

^{1/} Does not include volume removed for poles, piling, or products from woodcutting operations.

^{1/} Hardwood cut insignificant.

^{2/} Annual cut is the reduction in inventory volume resulting from the production of the given output of timber products.

FOREST SURVEY PROCEDURE

Procedures used in the reinventory of Umatilla and Union Counties were materially different from those used in the initial inventory. This change in procedures accounts for some significant differences in the forest-area and timber-volume statistics obtained.

Initial Inventory

The initial inventory of the counties' forests was conducted in 1936 by what is known as the "compilation method." In this method, existing information on forest types, timber volumes, areas logged, and other inventory data were collected from private timber owners and various public agencies. These data were checked in the field for reliability and were adjusted to Forest Survey specifications and standards. Forest-type and timber-volume data for areas not covered by reliable existing information were obtained through field reconnaissance. Timber-volume estimates for immature stands were determined from normal yield tables adjusted for site, age, and density of stand.

All land in the counties was classified as either forest or nonforest. Forest land was further classified as commercial or noncommercial; the commercial was still further classified by forest type, stand-size or condition class, and--in the case of young-growth stands--by stocking and age classes. All such types and classes were mapped in place on a 1-inch-to-the-mile base map of each forested township. Next, these township type maps were superimposed over current ownership-status plats and dot counted to obtain forest-type area statistics by ownership class. Type delineations on the township maps were then transferred to a base map of each county to form a county forest type map. The commercial forest land was also classified as to site quality, or forest productive capacity.

In-place, timber-volume estimates were based on (1) existing cruises collected and adjusted to the Forest Survey standard, (2) field samples, and (3) ocular appraisals. Cruises made by commercial cruisers were obtained for most of the privately owned timber, and Forest Service cruises were available for a large part of the national-forest lands. Separate volume estimates were computed for each of the commercial tree species and for each ownership class. Methods used in this initial inventory did not permit a statistical computation of accuracy of the estimate.

Reinventory

In the reinventory in 1957-58, the forest type maps of both counties were completely revised. This revision was accomplished through interpretation, classification, and field mapping on aerial photos that covered all the land area in the two counties. In mapping on aerial photos, types whose classification was difficult were examined more closely in the field.

Likewise, species composition of mixed stands was checked on the ground. The use of aerial photos in mapping resulted in type delineations of much greater accuracy and detail than was possible through the ground reconnaissance employed in the initial inventory. In the preparation of a revised type map, the delineations on the aerial photos were transferred to a 2-inch county base map through use of a reflecting projector.

Volume estimates for live sawtimber, growing stock, and salvable dead material were derived through a sampling procedure in which stands were measured on sample plots. A sample plot consisted of a cluster of three 1/5-acre circular subplots spaced at 6-chain intervals. Intensity of sampling was designed to produce an estimate of total volume to a specified sampling accuracy set by Forest Survey.

For those areas outside the national forests, and for the Union and Elkhorn Working Circles of the Wallowa-Whitman National Forests, type areas were determined by a dot count on the forest type map. The average per-acre volumes for sawtimber, poletimber, and seedling and sapling stands were obtained through a sampling procedure in which stands were sampled with a systematic grid of plots evenly distributed over each county. This was slightly modified in the Union and Elkhorn Working Circles, where the plots were selected randomly. Volume estimates were calculated by applying average per-acre volumes to the appropriate forest type areas.

A different procedure was used for the remainder of the national-forest area. Land classification for the North Fork, Grande Ronde, and Wenaha Working Circles of the Umatilla National Forest was based on a systematic grid of plots. Each subplot was first classified as commercial forest, noncommercial forest, or nonforest. The ratio of subplots in each class to the total number of subplots was applied to the total land area to determine the acreage of each classification. Subplots falling on commercial forest land were also classified by forest type and stand-size class as indicated by the plot tally. The percentage of subplots falling in each type was applied to the total area of commercial forest land in the working circle to determine the acreage of land in that type.

Volumes were determined in the following manner: For each working circle, an average volume per acre was determined by species for all the subplots falling on commercial forest land. These volumes, expanded by the total acreage of commercial forest land in each working circle, provided total volume by species for each working circle inventoried.

ACCURACY OF 1957-58 REINVENTORY DATA

Forest Area

With the exception of three national-forest working circles, acreages of forest type, stand-size class, and condition class were obtained

from forest type maps of the two counties. Thus no error due to sampling was involved in most of the two-county area. Errors due to techniques or judgment in the field were possible but difficult to evaluate. Throughout all phases of the work, however, close supervision and frequent checks assured a high level of accuracy and uniformity of standards.

The North Fork, Wenaha, and Grande Ronde Working Circles of the Umatilla National Forest were sampled for area. The chances are 19 out of 20 that the actual total area of commercial forest land in the Umatilla County parts of these three working circles is within plus or minus 4.8 percent of the estimated total of 313,631 acres, and that the noncommercial area is within plus or minus 57.0 percent of the estimated 17,195 acres. On the same basis, the area of commercial forest land in the Union County parts of the three working circles is within plus or minus 2.0 percent of the estimated total of 342,196 acres, and the noncommercial area is within plus or minus 112.6 percent of the estimated total of 6,082 acres.

Timber Volume

The chances are 19 out of 20 that the total board-foot volume of live sawtimber, if measured by a 100-percent cruise, would be within plus or minus 24.8 percent of the estimated total of 4,297 million board feet (Scribner rule) for Umatilla County and within plus or minus 8.8 percent of the estimated total of 6,167 million board feet for Union County. On the same basis, cubic-foot volume of growing stock from a 100-percent cruise would be within a range of plus or minus 11.0 percent of the estimated 1,289 million cubic feet for Umatilla County and 6.3 percent of the estimated 1,893 million cubic feet for Union County.

DIFFERENCES IN RESULTS OF INVENTORIES

Some of the differences between forest-type and timber-volume statistics resulting from the initial inventory and those resulting from the reinventory are due to physical change--such as cutting of stands, restocking of deforested areas, and ingrowth of stands into the next larger size class. Other differences are due to variations in the procedures used to interpret and classify forest conditions, and to variations in standards of utilization. Differences such as these preclude direct comparison of some of the statistics; comparison of other statistics is meaningful only after they have been adjusted to common standards.

Forest Area

Standards of merchantability and sampling techniques changed too extensively in the 1937-58 period to make area comparisons meaningful. The reclassification of barren areas at timberline, formerly classified as noncommercial forest land, to nonforest land probably contributed to the decrease in forest land area in Union County. Forest growth and changes

in merchantability standards may have contributed to the sharp increase in sawtimber acreage and the corresponding decrease in poletimber area in Union County. How many, if any, of these differences represent real changes is impossible to determine.

Table 24.--Comparison of forest area statistics for Umatilla and Union Counties, initial inventory and reinventory

(Thousand acres)						
Forest area	Both counties		Umatilla		Union	
	1936	1958	1936	1958	1936	1958
Sawtimber	812	1,049	413	432	399	617
Poletimber; seedlings and saplings	542	294	139	128	403	166
Nonstocked	3	13	1	7	2	6
Noncommercial unproductive	89	55	16	22	73	33
Total	1,446	1,411	569	589	877	822

Timber Volume

Some differences in volume estimates between 1936 and 1958 are due to differences in survey techniques, procedures, and methods. The effect of these differences on volume estimates cannot be adequately measured. The 1958 volume estimate has a calculated sampling error (page 35); however, no statistical evaluation of the 1936 estimates can be made.

Changes in utilization standards also contributed to volume differences. Changes included lowering the merchantable top diameter of sawtimber trees and reducing the minimum requirement of net volume in a merchantable sawtimber tree. In 1958, improved volume tables were used that gave a materially greater volume for a tree of a given size than did the tables used in the 1936 inventories. The large increase in the volumes of all conifer species other than ponderosa pine is probably at least partly a result of the increased economic importance of these species and the corresponding changes in utilization standards, particularly with regard to reduction of estimates of cull.

Table 25.--Comparison of timber volume statistics for Umatilla
and Union Counties, initial inventory and reinventory

(Million board feet, Scribner rule)

Species	Both counties		Umatilla		Union	
	1936	1958	1936	1958	1936	1958

DEFINITION OF TERMS

Land Area

Total Land Area

Includes dry land and unmeandered water surfaces.

Forest Land Area

Includes (a) land that is at least 10 percent stocked by trees of any size and capable of producing timber or other wood products, or of exerting an influence on the climate or on the water regime; and (b) land from which the trees described in "(a)" have been removed to less than 10-percent stocking and that has not been developed for other use.

Nonforest Land Area

Land that does not qualify as forest land.

Forest Land Classes

Commercial Forest Land Area

Forest land that is (a) producing, or physically capable of producing, usable crops of wood, usually sawtimber, (b) economically available now or prospectively, and (c) not withdrawn from timber utilization.

Noncommercial Forest Land Area

Forest land (a) withdrawn from timber utilization through statute, ordinance, or administrative order but which otherwise qualifies as commercial forest land, or (b) incapable of yielding usable wood products (usually sawtimber) because of adverse site conditions, or so physically inaccessible as to be unavailable economically in the foreseeable future.

Types

Forest Land Types

Forest land is typed on the basis of the predominant species, as indicated by cubic volume for sawtimber and poletimber stands and number of trees for seedling and sapling stands, or on the basis of forest condition, such as nonstocked cutover or burned-over land. Where none of the indicated species comprise 50 percent or more of a given stand, the stand is classified on the basis of plurality of cubic volume or number of trees.

Commercial Forest Land

Major forest types. Local forest types are grouped into generalized types. The major forest types in Umatilla and Union Counties are as follows:

Ponderosa pine. Forests in which 50 percent or more of the stand is ponderosa pine.

Lodgepole pine. Forests in which 50 percent or more of the stand is lodgepole pine.

Douglas-fir. Forests in which 50 percent or more of the stand is Douglas-fir.

Western larch. Forests in which 50 percent or more of the stand is western larch.

Fir-spruce. Forests in which 50 percent or more of the stand is true fir, Engelmann spruce, or both.

Hardwoods. Forests in which 50 percent or more of the stand is black cottonwood, or other hardwoods, singly or in combination.

Noncommercial Forest Land

Productive-reserved. Forest land withdrawn from timber utilization through statute, ordinance, or administrative order, but which otherwise qualifies as commercial forest land.

Unproductive. Forest land incapable of yielding usable wood products (usually sawtimber) because of adverse site conditions, or so physically inaccessible as to be unavailable economically in the foreseeable future.

Nonforest Land Types

Vegetative. Cultivated land, stump pasture, grass or brush on nonforest land.

Nonvegetative. Includes barrens and towns.

Unmeandered water. Includes unmeandered streams and lakes, and tideflats.

Tree Classes

Sawtimber Tree

Tree of commercial species, 11.0 inches d.b.h. and larger, that contains at least one 16-foot coniferous saw log or one 8-foot hardwood saw log to a variable top diameter never less than 8 inches inside the bark. Also, 25 percent or more of the gross board-foot volume must be free from rot or defect.

Poletimber Tree

Tree of commercial species, 5.0 to 10.9 inches d.b.h., in which 25 percent or more of the gross cubic-foot volume is free from rot and defect.

Seedling and Sapling Trees

Live trees of commercial species, less than 5.0 inches d.b.h., and of good form and vigor.

Cull Tree

Live tree of sawtimber or poletimber size that is unmerchantable for saw logs, now or prospectively, because of defect, rot, or species.

Sound cull tree. Live tree of sawtimber or poletimber size that contains 25 percent or more of sound volume but will not make at least one merchantable saw log, now or prospectively, because of roughness, poor form, or species.

Rotten cull tree. Live tree of sawtimber or poletimber size in which less than 25 percent of the total volume is sound.

Salvable Dead Tree

Standing or down dead tree that contains 25 percent or more of sound volume and at least one merchantable 16-foot coniferous or 8-foot hardwood saw log.

Stand-Size Classes

Sawtimber Stand

Stand of sawtimber trees having a minimum per-acre net volume (International 1/4-inch rule) of 1,500 board feet.

Large sawtimber stand. Stand in which the majority of the volume is in trees 21.0 inches d. b. h. and larger.

Small sawtimber stand. Stand in which the majority of the volume is in trees from 11.0 to 20.9 inches d. b. h.

Uncut sawtimber stand. Uncut sawtimber stand or sawtimber stand in which less than 10 percent of its volume has been removed by cutting.

Residual sawtimber stand. Sawtimber stand in which 10 percent or more of the volume has been removed by cutting, and in which the residual per-acre volume (International 1/4-inch rule) amounts to 1,500 board feet.

Poletimber Stand

Stand failing to meet sawtimber stand specifications but at least 10 percent stocked with poletimber and larger (5.0 inches d. b. h. and larger) trees and with at least half the minimum stocking in poletimber trees.

Seedling and Sapling Stand

Stand not qualifying as either a sawtimber or poletimber stand but at least 10 percent stocked with trees of commercial species and with at least half the minimum stocking in seedling and sapling trees.

Nonstocked Area

An area less than 10 percent stocked with present or potential growing-stock trees.

Stocking

Stocking is the extent to which growing space is effectively utilized by present or potential growing-stock trees of commercial species. "Degree of stocking" is synonymous with "percent of growing space occupied" and means the ratio of actual stocking to full stocking for comparable sites and stands. Stocking may be measured in terms of number of trees, volume, basal area, cover canopy, or other criterion or combination of criteria.

Well-stocked stand. Stand that is 70 percent or more stocked with present or potential growing-stock trees.

Medium-stocked stand. Stand that is 40 to 69 percent stocked with present or potential growing-stock trees.

Poorly stocked stand. Stand that is 10 to 39 percent stocked with present or potential growing-stock trees.

Nonstocked area. An area less than 10 percent stocked with present or potential growing-stock trees.

Timber Volume

Live Sawtimber Volume

Net volume in board feet of live sawtimber trees of commercial species:

Scribner rule. The common board-foot log rule used in determining volume of sawtimber in the Pacific Northwest.

International 1/4-inch rule. The standard board-foot log rule adopted nationally by the Forest Service in the presentation of Forest Survey volume statistics.

Growing Stock

Net volume in cubic feet of live sawtimber trees and live poletimber trees from stump to a minimum 4.0-inch top (of central stem) inside bark.

All-Timber Volume

Net volume in cubic feet of live and salvable dead sawtimber trees and poletimber trees of commercial species, and cull trees of all species from stump to a minimum 4.0-inch top inside bark.

Timber Cut

Annual Cut of Live Sawtimber

The net board-foot volume of live sawtimber trees cut or killed by logging on commercial forest land during a specified year.

Timber products from live sawtimber. The volume of timber products cut from live sawtimber.

Logging residues from live sawtimber. The volume of sound wood in live sawtimber trees cut or killed by logging on commercial forest land and not converted to timber products.

Annual Cut of Growing Stock

The net cubic-foot volume of live sawtimber and poletimber trees cut or killed by logging on commercial forest land during a specified year.

Timber products from growing stock. The volume of timber products cut from growing stock.

Logging residues from growing stock. The volume of sound wood in growing stock cut or killed by logging on commercial forest land and not converted to timber products.

TREE SPECIES

Tree species commonly found in Umatilla and Union Counties include:

Softwoods:

Ponderosa pine (Pinus ponderosa)
Lodgepole pine (Pinus contorta)
Douglas-fir (Pseudotsuga menziesii)
White fir (Abies concolor or A. grandis)^{1/}
Subalpine fir (Abies lasiocarpa)
Western larch (Larix occidentalis)
Engelmann spruce (Picea engelmannii)
Western juniper (Juniperus occidentalis)
Mountain hemlock (Tsuga mertensiana)
Whitebark pine (Pinus albicaulis)
Western white pine (Pinus monticola)

Hardwoods:

Black cottonwood (Populus trichocarpa)
Quaking aspen (Populus tremuloides)
Northwestern paper birch (Betula papyrifera
var. subcordata)
Red alder (Alnus rubra)
Bigleaf maple (Acer macrophyllum)

^{1/} No attempt was made to separate A. concolor (white fir) from A. grandis (grand fir). White fir, as specified in the Forest Survey in the Pacific Northwest, may be concolor, grandis, or both.
