INTRODUCTION AND AUTHORS' DIVISION OF LABOR

This article includes observations not published elsewhere that were independently made by several observers. Drafts of the results have undergone extensive revision and reorganization during the past 10 years, with the present format emerging in August 1993.

Bob Llewellyn made many or most observations for Chaps. 2 and 4-7. He also commented on various drafts (April 1985, October 1989, February 1990, and August 1993) of material in these

Chapters that had been merged with Floyd Schrock's observations (Schrock and Bayer 1994) prior to July 1993.

Bayer made most of the observations for Chap. 3. He also compiled everyone's field notes into the present format and prepared drafts of several chapters for Llewellyn's comments and for publication.

Bird records for this general area are also included elsewhere in this issue of Journal of Oregon Ornithology.

\*\*\*\*\*  
**Chap. 1. BIRDS ABOVE 2,000 FT ON EUCHRE MOUNTAIN**  
\*\*\*\*\***1-A. INTRODUCTION AND SHORTCOMINGS**

Euchre Mountain (elevation of 2,446 ft [745 m]) is north of the town of Siletz (Fig. 1.1).

There were only three observations and 31 records, all by Floyd Schrock. Nevertheless, they are of interest because few observations have been made above 1,000 ft (305 m) in Lincoln County and because two of the observations give an idea

of some of the probable nesting birds.

Many more high elevation observations with specified habitats and good observation effort are needed in Lincoln County because these few observations suggest that there are fewer species nesting high on Euchre Mountain (Table 1.1) than at lower elevations (e.g., Faxon and Bayer 1991). This is not surprising because the number of breeding species declines in Life Zones at higher elevations in Oregon (Bayer 1993:6).

\*\*\*\*\*

### 1-B. STUDY AREA AND METHODS

Location: Township 8S, Range 10W, Sections 35 & 36

Area Studied: ?

Habitat(s) Studied: Unknown

Elevation: above 2000 ft (above 610 m)

Distance to Coastline: about 8.7 mi (about 14 km).

At unknown sites on the Mountain, Schrock made observations of unknown duration and with unknown effort on the dates given in Table 1.1. These records are best treated as presence data only, not presence/absence data (Bayer 1993:14-15).  
\*\*\*\*\*

### 1-C. TABLE AND FIGURE

**Table 1.1.** Birds records above 2,000 ft (610 m) on Euchre Mountain by Floyd Schrock. The three observations were on 4 October 1981, 19 June 1982, and 1 July 1982.

Codes:

A.=presence on observation day during 1-15th of month.

.Z=presence on observation day during 16th-end of month.

?=species not recorded but there were either no observations or too few observations to tell if the species was absent.

**Chap. 2. BIRDS NEAR THE TOWN OF SILETZ****2-A. INTRODUCTION**

This is an amalgamation of records incidentally and independently made by various observers near the town of Siletz (Fig. 1.1).

**2-B. STUDY AREA, METHODS, & SHORTCOMINGS**

Location: Township 9S/10S, Range 10W

Area Studied: ?

Habitat(s) Studied: Unknown

Elevation: ? (probably <1000 ft [<305 m])

Distance to Coastline: ?.

It is unfortunate that the location of many of these observations is not known precisely. All

were probably within 3 mi (5 km) of the town of Siletz (Fig. 1.1) in the Siletz River Valley.

All observations were incidentally made. Further, there were few observations, so there are many shortcomings to these data.

**2-C. GENERAL DISCUSSION**

There were a total of 61 observations and 103 records (Tables 2.1 and 2.2). Few taxa were recorded each observation or month (Tables 2.1 and 2.2). Most of the observations were by Floyd Schrock, Darrel Faxon, and Bob Llewellyn (Table 2.3).

Information about individual species is given in the Species Accounts (section 2-E).

**2-D. TABLES**

**Table 2.1.** Number of Observations and number of Taxa/Observation near the town of Siletz. There was one Observation per day.

Codes:

**Table 2.2.** Total bird species recorded each month and year near the town of Siletz. These data are calculated from Table 2.1 and section 2-E.

Total Taxa=total number of taxa recorded each year

Records/Taxon=Total Records for year divided by the total number of taxa noted that year

Records/Obs.=Total Records for year divided by the number of Observations from Table 2.1  
. =zero ("." is used to enhance readability)

MAX=maximum

#Taxa=total number of taxa seen during all of 1980-1991.

Codes:

Record=one bird taxon seen or heard during one Observation

Monthly Records (calculated from Table 2.1)=  
(number of Observations) X (Mean Taxa/Obs.), rounded to the nearest whole number

Total Records=sum of Monthly Records

2-E. SPECIES ACCOUNTS

Years of occurrence of species near the town of Siletz. These data are calculated from the individual observations, which are not given elsewhere.

Codes:  
(number)=year in which a taxon was recorded  
(e.g., 90=1990)

?=species not recorded, so the species may have been absent or it may have been present but overlooked.

Species	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Great Blue Heron	91	?	?	?	?	?	?	?	?	?	?	?
	On 8 January 1991, Llewellyn saw one Great Blue Heron flying near Twin Bridges.											
Cattle Egret	?	?	?	?	?	?	?	?	?	?	81	83
	On 25 November 1981, Schrock saw one immature Cattle Egret in the Siletz football field. On 9 & 16 December 1983, Stoltzfus saw five in a barnyard.											
Green-backed Heron	82	?	?	88	?	?	?	?	?	?	?	?
White-fronted Goose	?	?	?	?	?	?	?	?	?	84	?	?
	On 8 October 1984, Schrock saw 60-70 White-fronted's fly over.											
Canada Goose	?	?	?	?	?	?	?	?	?	81	?	?
	On 6 October 1981, Schrock saw an unspecified number of Canada's fly over in an unspecified direction.											
Turkey Vulture	?	?	?	?	?	?	87	87	?	?	?	?
Black-shouldered Kite	?	?	?	?	?	?	84	82	82	82	?	82
	On 26 August 1982, Schrock saw one kite at Milepost 20 along Highway 229.											
	On 26 and 29 December 1982, Schrock saw one kite at Twin Bridges. For the rest of these sightings, only one was reported, but the location was not specified.											
Cooper's Hawk	?	?	?	?	?	?	?	81	?	?	?	?
	In mid-August 1981, Schrock saw an adult Cooper's Hawk with two young, but he did not record whether the young were in a nest or fledged.											
No. Bobwhite	?	?	?	?	?	?	?	?	?	?	?	81
	In late December 1981, Jennings noted a probable bobwhite; no other details are available.											
California Quail	82	?	?	?	?	?	?	?	?	?	?	?
Greater Yellowlegs	?	?	?	85	?	?	?	?	?	?	?	?
Common Snipe	?	?	?	?	?	?	?	?	87	?	?	?
Caspian Tern	?	?	?	?	?	?	84	81	?	?	?	?
	On 7 August 1981, Mike Bauman heard an adult Caspian Tern and its young calling and flying overhead in a thick fog just north of the town of Siletz about 7.5 mi (12.2 km) from the shoreline.											
	On 24 July 1984, Schrock reported that an adult and immature flew over.											
Marbled Murrelet	?	?	?	?	?	?	?	87	?	?	?	?
	On 21 September 1987, a recent fledgling murrelet was found alive in the parking lot of a store in Siletz; it was brought to Roy Lowe, USFWS biologist, who identified and released it.											
Mourning Dove	?	?	?	91	?	?	?	?	?	?	?	?
Barn Owl	?	?	?	?	?	81	81,82	81	?	?	?	81,82,85
Western Screech-Owl	?	?	?	?	?	?	82	?	?	?	?	?
Common Nighthawk	?	?	?	?	?	?	91	?	?	?	?	?
Hairy Woodpecker	90	?	?	?	?	?	?	?	?	?	?	?
Pileated Woodpecker	?	?	?	?	?	?	?	89	90	?	?	?
Willow Flycatcher	?	?	?	?	?	?	87	?	?	?	?	?
Tree Swallow	?	?	?	88	88	?	?	87	?	?	?	?
Violet-green Swallow	?	?	?	88	88	?	87	?	?	?	?	?
Cliff Swallow	?	?	?	88	88	?	87	87	?	?	?	?
Barn Swallow	?	?	?	88	88	?	87	87	87	?	?	?

(section 2-E continued on next page)

## (Section 2-E continued)

Species	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Marsh Wren	?	88	?	?	?	?	?	?	?	?	?	?
American Robin	?	88	?	88	88	?	?	87	?	?	?	?
No. Mockingbird	?	?	?	?	?	?	?	?	?	?	?	86
	During 15-18 December 1986, Miller saw one mockingbird tapping on the window of his house at Crawford Road, about 5 mi (8 km) north of the town of Siletz and about the same distance east of Depoe Bay; on the 18th, the bird was allowed to fly into his house, where it was captured.											
American Pipit	?	?	?	?	?	?	?	?	?	?	81	?
Cedar Waxwing	?	?	?	?	?	?	?	?	?	82	?	?
	On 16 October 1982, Schrock saw about 250 waxwings; this may have been a migration.											
No. Shrike	?	?	?	?	?	?	?	?	?	?	81	?
	On 1 November 1981, Schrock saw one Northern Shrike.											
Black-thr. Gray Warbler	?	?	?	?	90	?	?	?	?	?	?	?
Common Yellowthroat	?	?	?	?	88	?	?	?	?	?	?	?
Black-headed Grosbeak	?	?	?	?	90	?	?	?	?	?	?	?
Vesper Sparrow	?	?	?	?	?	?	?	91	?	?	?	?
	On 9 August 1991, Anthony Floyd saw one Vesper Sparrow near a cemetery at the town of Siletz in an open field; he noted that it wasn't a juvenile junco (which could be confused with a Vesper Sparrow).											
Lark Sparrow	?	?	?	?	?	?	?	80	?	?	?	?
	On 31 August 1980, Schrock saw one Lark Sparrow that landed on a bare, sandy patch of ground in the backyard of a house in the town of Siletz. He watched it for about 15 seconds from a distance of about 12 ft (3.7 m). It had the distinct head markings characteristic of this species, and the white tail markings showed plainly when it flew away.											
Savannah Sparrow	?	?	?	88	?	?	?	87	?	?	?	?
Golden-crowned Sparrow	?	88	?	?	?	?	?	?	?	?	?	?
Western Meadowlark	82	?	?	?	?	?	?	?	?	?	?	?
Brewer's Blackbird	?	88	?	88	88	?	87	87	87	88	81	87
	All 1987-1988 records of Brewer's Blackbirds were within the town of Siletz.											
Purple Finch	90	?	?	?	?	?	?	?	?	?	?	?
House Finch	?	?	?	88	88	?	87	?	?	?	?	?
American Goldfinch	?	?	?	?	?	?	87	?	?	?	?	?

\*\*\*\*\*  
**Chap. 3. GREAT BLUE HERON COLONY AT WEST FORK OF MILL CREEK, WEST OF THE TOWN OF SILETZ**  
\*\*\*\*\*

**3-A. INTRODUCTION**

Bayer studied Great Blue Heron colonies for several years (e.g., Bayer and McMahon 1981, Bayer 1982). Because not all of his data for this colony are given in his other publications, they are given here.

**3-B. STUDY AREA**

Location: T10S, R10W, Section 7, SE 1/4 of SW 1/4 (Nehls 1972:6); however, Bayer's impression was that this heronry was actually in the next section to the west (T10S, R11W, Section 12, SE 1/4).

Area Studied: ?

Habitat(s): Forest

Elevation: 300-500 ft (91-152 m)

Distance to Coastline: about 4.5 mi (7.3 km).

There are several Mill Creeks in this area; this Mill Creek is west of the town of Siletz (Fig. 1.1).

**3-C. RESULTS****3-C-1. GREAT BLUE HERONS**

A summary of the number of inactive and active nests, active nests/tree, and species of

**3-D. TABLE**

**Table 3.1. Number of inactive and active Great Blue Heron nests and species of trees with active nests at the West Fork of Mill Creek heronry.** McMahon (1974:9-10) and Bayer defined an active

trees with active nests is given in Table 3.1.

In 1974, nests were only in Sitka spruce with an average height of about 90 ft (27 m), a height range of about 85-100 ft (26-30 m), an average diameter of about 2.9 ft (0.9 m), and a diameter range of 2.7-4.0 ft (0.8-1.2 m) (McMahon 1974:66).

In 1974-1976, there were two groves of nest trees that were about 200 ft (61 m) apart (McMahon 1974:66; Bayer pers. obs.).

In 1979, the average thickness of seven hatched eggshells at this colony was 0.3324 mm ( $SD=0.012$ , range 0.3124-0.3454 mm); these data are not in Bayer (1982). This average was 13.9% less than the pre-1947 Pacific Northwest average (Bayer 1982).

The Oregon Department of Fish and Wildlife (ODFW) may have post-1979 information about this colony, which appeared to have been abandoned sometime in the 1980's, based on one observation during a winter by Bayer with Mary Walter of the ODFW and a representative of the Oregon Department of Forestry, the record of which Bayer has misplaced.

**3-C-2. VARIED THRUSHES**

On 8 June 1976, Bayer heard a Varied Thrush singing here, which suggests that they may have nested here. Thus, they can nest at low elevations in large coniferous timber.

nest as one from which eggshells had been dropped, a nest with adults or young, or a nest with droppings ("whitewashing"). --no data available, N=number, +at least the number indicated.

4-H. Figure and Tables-----	184

**4-A. INTRODUCTION**

Bob Llewellyn, his wife Martha Doldt, and their daughter Chelsea live in the Logsdon area (Fig. 4.1). All three made some observations, although Bob made the most and recorded all of them.

**4-B. STUDY AREA**

Location: Township 9S, Range 9W, SE 1/4 of Section 29

Area Studied: ?

Habitat(s) Studied: Mixed (Residential, Farmland, Riparian, Shrub/Forest)

Elevation: about 200-280 ft (61-85 m)

Distance to Coastline: 12.2-12.6 mi (19.8-20.4 km).

Observations were within the dotted Study Area in Fig. 4.1. The approximate boundaries to the north was Highway 307, to the west was the Siletz River, to the east was the Beaver Pond, and to the south was River Mile 50 (Fig. 4.1).

Many observations were at the Llewellyn's home (Fig. 4.1). They had cracked corn and hummingbird feeders and also supplied peanut butter at their feeders. They had 1-2 dogs and three cats; their neighbors also had cats.

Around their house, they had a maple tree that was about 30 ft (9 m) high, two Douglas firs that were about 50 ft (15 m) tall, three lodgepole pines about 25 ft (8 m) high, a black locust tree about 25 ft (8 m) tall, and some apple trees. On adjoining property there was himalaya blackberries, some western hawthorns, and a row of 8-10 red cedars that were about 40 ft (12 m) high.

Bob also made many observations while walking to and from the Siletz River and the Beaver Pond (Fig. 4.1). This area was a mixture of fields, brush, and riparian forest.

**4-C. METHODS**

Llewellyn's observations were made incidentally with or without binoculars at his home or during walks from 1986 through June 1993; earlier observations were not clearly separable for this Study Area and are included in Chap. 7.

He did not try to make systematic observations, so more birds may have been present than were recorded. He did not note the time of day or duration of his observations. His hikes took 30-60 minutes, and he recorded his bird notes when he came home.

**4-D. TOLERABLE OBSERVATION EFFORT (TOE)**

The term Tolerable Observation Effort (TOE) is used to emphasize that if certain criteria are attained, effort is judged Tolerable (i.e., moderately good or passable), so that observations can be considered as presence/absence data, not just as presence data (Bayer 1993:14-15).

Because Llewellyn considered his observations to be incidentally made and he rarely recorded at least eight species/observation (Table 4.1), none of his months are classed as TOE.

**4-E. SHORTCOMINGS OF OBSERVATIONS****4-E-1. INTRODUCTION**

In any ornithological undertaking there are shortcomings, and this is no exception. Many possible shortcomings are examined in Bayer (1993:28-31); here, only the most relevant ones are examined.

**4-E-2. SHORTCOMING: OVERLOOKING SPECIES**

Because Llewellyn did not attempt to systematically record all species, many may have been missed, particularly shy or inconspicuous species. Further, he may also have consistently recorded species with which he was familiar and overlooked unfamiliar species.

**4-E-3. SHORTCOMING: LOW OBSERVATION EFFORT**

Llewellyn made few or no observations during many months, particularly during June-November (Table 4.1). Thus, the seasonality of many bird species is not as clear as it would have been if there had consistently been three or more observations/month. Because of the usually low observation effort, these records are best

considered as presence data, not presence/absence data (section 4-D).

#### 4-E-4. SHORTCOMING: ERRORS IN DETERMINING FIRST AND LAST DATES

Dates when Llewellyn first or last saw a species are given, if available. However, species may have been present before his First date or after his Last date because his observation effort was not daily and often may not have been long enough to detect all passing migrants. The accuracy of First and Last dates is examined in detail in Faxon and Bayer (1991:29-31).\*\*\*\*\*

#### 4-F. GENERAL RESULTS AND DISCUSSION

##### 4-F-1. NUMBER OF TAXA

Few taxa were usually recorded each observation, and the most ever reported was 16 in June 1988 (Table 4.1). The average number of taxa/observation was usually less than 5.0 (Table 4.1).

The range in the maximum number of taxa noted each month was 7-22, and the range in total taxa/month for all years was 16-36 (Table 4.2). Because of low observation effort during June-November (Table 4.1), it is unclear if there were any seasonal trends in the number of taxa/month.

There was a total of 77 taxa, with a range of 24-51 taxa/year (Table 4.2). The greatest number of species was recorded in 1990--the year with the greatest number of observation days and total records (Tables 4.1 and 4.2).

Only seven taxa were waterbirds, and 71% of these were observed in only 1-2 years of the years with many observations (Table 4.3). In contrast, 37% of terrestrial bird taxa were recorded in only 1-2 years (Table 4.3); the species recorded in each of these years included American Crow, Black-capped Chickadee, Winter Wren, Ruby-crowned Kinglet, American Robin, Rufous-sided Towhee, Fox, Song, and White-crowned sparrows; and Red-winged Blackbird (section 4-G).\*\*\*\*\*

#### 4-G. TAXA ACCOUNTS

Times are in Pacific Standard Time (PST) by the 24 hour clock (i.e., 1300 are added to times after 1200; 1 PM=1300, 2 PM=1400).

#### 4-F-2. NESTING SPECIES

Species with adults at a nest, with nestlings, or with fledged or nonfledged young still receiving parental care include Barn Swallow, Bushtit, Bewick's Wren, Black-headed Grosbeak, and House Sparrow (section 4-G). But searches for nests may have revealed that other species may have also nested, since they were often present during the nesting season (section 4-G).

#### 4-F-3. EFFECTS OF SNOWFALL AND ICY WEATHER

Snow is rare in the Logsdon Valley, but there was snow on the ground on 1-8 February 1989, 12-16 February 1990, and late December 1990 at Llewellyn's home. When snow covered the ground, birds were more common at feeders.

For example, on 2 February 1989, birds were abundant at his feeder; they included Varied Thrushes, Eurasian Starlings, Steller's Jays, Dark-eyed Juncos, Song Sparrows, and Rufous-sided Towhees. On February 3, they were joined by Red-winged Blackbirds, Fox Sparrows, and crows.

During the February 1990 cold spell and snowfall, many birds also used his feeders. When his feeder was filled with bird feed on the morning of February 13, the following birds arrived within about five minutes: 40-50 Dark-eyed Juncos, 12 Pine Siskins, two Varied Thrushes, one Northern Flicker, one Purple Finch, several House Sparrows, two Song Sparrows, three Red-winged Blackbirds, up to 25 crows, two Rufous-sided Towhees, and four Steller's Jays. On February 16, the following birds were sometimes at his feeder: 30 crows, 50 Pine Siskins, 30 Dark-eyed Juncos, three male Red-winged Blackbirds, six Varied Thrushes, two Purple Finches, two Rufous-sided Towhees, three Song, two Fox, and one White-throated sparrow; one Northern Flicker, six American Robins, and six Steller's Jays.

In late December 1990, a White-throated Sparrow first appeared at Llewellyn's feeder after the cold and snow on December 20. Also at his feeders (some of which included peanut butter) on December 20-23 during the cold snap were crows, Steller's Jays, Song and Fox sparrows, Varied Thrushes, Dark-eyed Juncos, Rufous-sided Towhees, Black-capped Chickadees, and Northern Flickers.\*\*\*\*\*

##### 4-G-1. YEARS WITHOUT RECORDS

A year may be listed for a taxon even though the taxon was not recorded that year. This is done to make it clearer that a taxon was not found every year. Years of absence are given particularly for taxa that are present nearly every year.

**4-G-2. FIRST AND LAST DATES**

These are the first and last dates, respectively, that a taxon was recorded. Note that a taxon may have been present before a First or after a Last date (Faxon and Bayer 1991:29-31). A First or Last date is only listed if there appears to be enough observations to somewhat accurately determine the date.

=not possible to assign a First or Last date because the bird taxon was present continually or erratically throughout the year, because observation effort may have been inadequate to determine the First or Last date reasonably accurately, or because the date was not recorded.

**4-G-3. SEMIMONTHLY FREQUENCY**

A.=taxon recorded in the first part (1-15th) of a month; it wasn't noted later that month.  
.Z=taxon recorded from the 16th to the end of a month; it wasn't noted earlier that month.  
AZ=taxon recorded during both portions (1-15th and 16th-end) of a month.  
?=taxon not recorded during a month. It is not possible to determine if the absence is a result of low observation effort or from the absence of the taxon.

**4-G-4. AVERAGE MONTHLY FREQUENCY**

AV MONTH. FREQ=average monthly frequency of occurrence of a taxon (e.g., Bayer 1993:20).  
+=taxon recorded during one month.  
X=taxon recorded during two or more months.  
?=the taxon was not recorded but there were no observations or observation effort may have been inadequate to detect it.

 88 - - A. ? .Z ? ? ? ? ? ? ? ? .Z ? ?

AV MONTH. FREQ + + + ? ? ? ? ? + ? ?

In Betty Coates' field across Highway 307  
 from Llewellyn's house, one was seen on  
 15 February 1987 and 9 January 1988.

During Llewellyn's walk to his Beaver Pond,  
 he noted one on 20 March and two on 16 October  
 1988. The one on March 20 was harassing a male  
 Northern Harrier.

**4-G-11. NORTHERN HARRIER**

The lack of summer records may be a result of low observation effort, not this species' absence.

During snowy or icy weather, these birds were sometimes at Llewellyn's feeder (section 4-F-3).

**4-G-78. HOUSE FINCH**

Llewellyn never saw this species at his house or during his walks to or from the Beaver Pond.

AV MONTH. FREQ +\* X\* \* \* \* \* +\* \* \* \* \*

\* Llewellyn noted that House Sparrows were very common here, although he didn't record them often.

This species sometimes nested here.

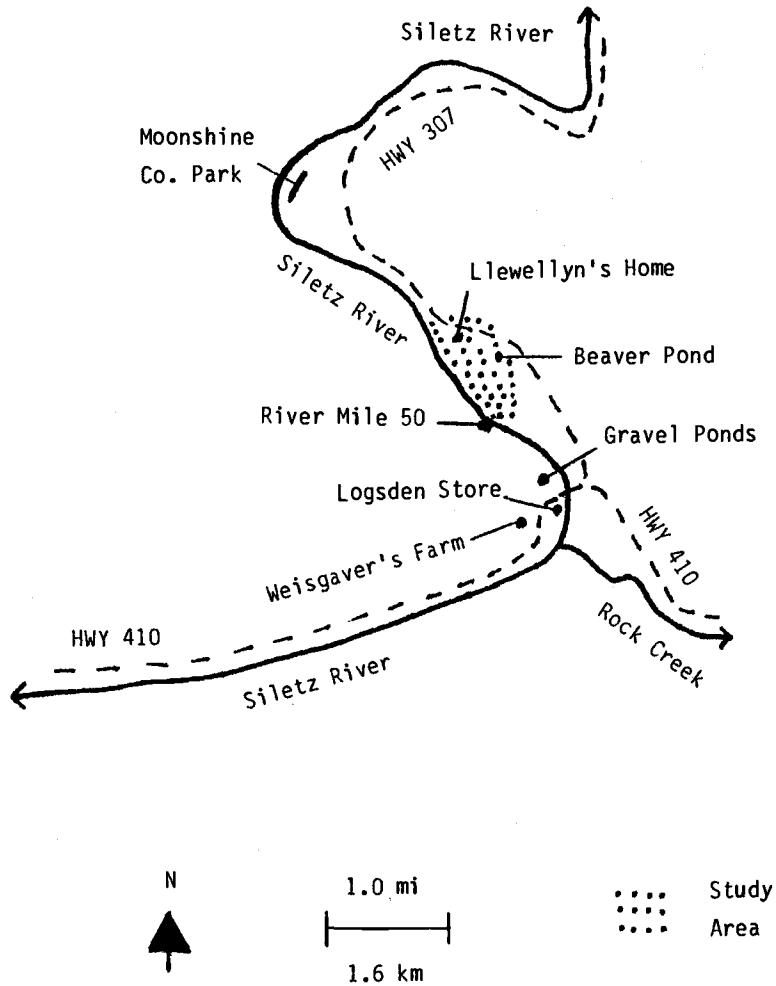

In 1993, Llewellyn found a House Sparrow nest in one of his nestboxes on top of a dead adult Tree or Violet-green swallow. In two other nestboxes in 1993, House Sparrows are presumed to have hurt swallow nesting: a dead Tree or Violet-green swallow with its head and neck feathers pecked off was found in one nestbox, and another nestbox had four dead Tree or Violet-green swallow nestlings covered with bird droppings.

During snowy or icy weather, these birds were sometimes at Llewellyn's feeder (section 4-F-3).

\*\*\*\*\*  
**Chap. 5. LANDBIRDS NEAR MOONSHINE COUNTY PARK**  
\*\*\*\*\*

**5-A. INTRODUCTION**

This is an amalgamation of 23 observations and 28 records that were mostly made by Bob Llewellyn (Table 5.1). Waterbird records for the Siletz River in this area are given elsewhere (Llewellyn and Bayer 1994: Table 2.3).

Information about individual species is in section 5-D.

**5-B. STUDY AREA, METHODS, & SHORTCOMINGS**

Location: Township 9S, Range 9W, Sections 19, 20, & 29

Area Studied: ?

Habitat(s) Studied: Unknown

Elevation: <1000 ft (<305 m)

Distance to Coastline: >11.3 mi (>18.3 km).

All observations are within 1.5 mi (2.4 km) of the Park, in the Siletz River Valley, east of the Siletz River, north of Llewellyn's home study area (Chap. 4), and probably south of the north end of the Park (Fig. 4.1). There was only one observation within the Park itself.

Shortcomings are that there are few observations, observation effort is unknown, and the site of observations is usually not precisely known.

**5-C. TABLE**

**Table 5.1.** Number of landbird observations and records per observer near Moonshine County Park during 1983-1991. .=zero.

**5-D. SPECIES ACCOUNTS**

Years of occurrence of landbird species near Moonshine County Park. These data are calculated from the individual observations, which are not given elsewhere.

Codes:  
(number)=year in which a taxon was recorded  
(e.g., 90=1990)

?=species not recorded, so the species may have been absent or it may have been present but overlooked.

Species	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Turkey Vulture	?	?	88	?	?	?	?	?	89,90	?	?	?
	On 16 August 1990, Llewellyn saw four Turkey Vultures, a Red-tailed Hawk, and a Sharp-shinned Hawk flying in the same thermal; it is unknown if they were migrating.											
Black-shouldered Kite	83	?	?	?	?	?	?	?	?	?	?	?
	On 23 January 1983, Schrock saw two kites.											
Sharp-shinned Hawk	?	?	?	?	?	?	?	90	?	?	?	?
	On 16 August 1990, Llewellyn saw four Turkey Vultures, a Red-tailed Hawk, and a Sharp-shinned Hawk flying in the same thermal; it is unknown if they were migrating.											
Red-tailed Hawk	?	?	88	?	?	?	?	90	?	89	?	?
	On 16 August 1990, Llewellyn saw four Turkey Vultures, a Red-tailed Hawk, and a Sharp-shinned Hawk flying in the same thermal; it is unknown if they were migrating.											
American Kestrel	?	91	86,87,89	?	?	87	?	?	?	89	86	?
	On 5 June 1987, a kestrel was flying with a snake, perhaps to a nest, across from Socia's about a mile northwest of Llewellyn's home (Fig. 4.1); also in 1987, Llewellyn saw one kestrel in this area on June 6 and 16. So it is possible that they may have been nesting in this area in 1987.											
Gyrfalcon	?	?	?	?	?	?	?	?	?	?	?	87
	On 26 December 1987, Snow reported one gray-phase Gyrfalcon that is unconfirmed; no other details are available.											
Western Kingbird	?	?	?	?	87	?	?	?	?	?	?	?
	On 13 and 16 May 1987, Llewellyn saw one Western Kingbird.											
Western Bluebird	?	?	85,87	?	?	?	?	?	?	?	?	?
	On 2 March 1985, Schrock saw three Western Bluebirds; on 22 March 1987, Llewellyn saw a pair.											
American Robin	90	?	?	?	?	?	?	?	?	?	?	?
	On 24 January 1990, Llewellyn saw about 100 robins in a field.											
American Pipit	?	?	?	?	?	?	?	?	?	89	?	?
	On 4 October 1989, Llewellyn saw 20 pipits, which is many more than is usually seen in Lincoln County.											
Savannah Sparrow	?	?	?	87	88	?	86	?	?	?	?	?
White-throated Sparrow	?	?	?	91	?	?	?	?	?	?	?	?
	On 8 April 1991, Llewellyn saw one White-throated Sparrow.											
Western Meadowlark	?	?	?	87	?	?	?	?	?	?	?	?
American Goldfinch	?	?	?	?	?	91	?	?	?	?	?	?
	On 16 June 1991, Llewellyn saw about 50 American Goldfinches, a large concentration.											

\*\*\*\*\*  
Chap. 6. LANDBIRDS AT OR NEAR THE LOGSDEN STORE, GRAVEL PONDS, AND WEISGAVER'S FARM  
\*\*\*\*\*

**6-A. INTRODUCTION**

This is an amalgamation of 36 observations and 67 records made by Bob Llewellyn (Table 6.1). Waterbird records for the Logsdon Gravel Ponds are given elsewhere (Llewellyn et al. 1994: Chap. 3).

Information about individual species is in section 6-D.

\*\*\*\*\*  
**6-B. STUDY AREA, METHODS, & SHORTCOMINGS**  
\*\*\*\*\*

Location: Township 9S, Range 9W, Section 33

Area Studied: ?

Habitat(s) Studied: Unknown

Elevation: 180-240 ft (55-73 m)

Distance to Coastline: 12.7-13.0 mi (20.6-21.1 km).

All observations are within 0.5 mi (0.8 km) of the Logsdon Store, Gravel Ponds, and Weisgaver's farm (Fig. 4.1).

The shortcomings are that there are few observations and observation effort is unknown and usually low.

**6-C. TABLE**

**Table 6.1.** Number of landbird observations and records per observer at or near the Logsdon Store, Gravel Ponds, and Weisgaver's farm during 1986-1991. .=zero.

Observer	Observations.....			Records.....		
	1980-		1990-	1980-		1990-
	1989	1991	Total	1989	1991	Total
Bob Llewellyn	17	19	36	20	47	67

**6-D. TAXA ACCOUNTS**

Years of occurrence of landbird taxa at or near the Logsdon Store, Gravel Ponds, and Weisgaver's farm (Fig. 4.1). These data are calculated from the individual observations, which are not given elsewhere.

## Codes:

(number)=year in which a taxon was recorded  
(e.g., 90=1990)

?=species not recorded, so the species may have been absent or it may have been present but overlooked

PST=Pacific Standard Time by the 24 hour clock  
(add 1300 to times after 1200; 1 PM=1300).

Taxon	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Turkey Vulture	?	?	?	?	91	?	?	?	?	?	?	?
Black-shouldered Kite	?	87	?	?	?	?	?	?	?	?	?	?
On 10 February 1987, one kite was seen at Weisgaver's farm.												
Northern Harrier	?	?	?	?	90	?	?	?	?	?	?	?
On 27 May 1990, one adult male harrier was at the Gravel Ponds.												
Red-tailed Hawk	?	87	?	?	91	?	?	?	?	?	?	?
American Kestrel	?	87	?	91	?	?	?	?	?	?	?	?
unknown quail	91	?	?	?	?	?	?	?	?	?	?	?
On 24 January 1991, 25 quail were at the Gravel Ponds.												
Northern Flicker	?	?	?	?	?	?	?	90	?	?	?	?
Willow Flycatcher	?	?	?	?	90	?	?	?	?	?	?	?

(section 6-D continued on next page)

Chap. 6. Landbirds At or Near Logsden Store

(section 6-D continued)

Taxon	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
unknown swallows	?	?	90,91	?	?	?	88,90	91	89,90,91	?	?	?
FALL.--On 2 July 1988, adult and fledgling swallows were flocking on wires; on 5 & 10 September 1989, several hundred were present; on 25 July 1990, many were perched on wires. In September 1990, hundreds were present on the 4th at 0700 PST, but none were present at 0700 PST on the 6th and 7th. In 1991, none were present in the morning or afternoon on September 11, but there were over a hundred on the wires on September 12 at 1700 PST.												
SPRING.--On 17 March 1990, 200-300 were at the Store; on 22 March 1991, about 30 were counted.												
Tree Swallow	?	?	87	87,90	91	?	?	?	?	?	?	?
Also see unknown swallows. On 16 April 1987, 40 were at the Gravel Ponds.

#### **7-A. INTRODUCTION**

Bob Llewellyn lives near Logsdon (Fig. 4.1), made 256 of the 273 observations, and recorded 1598 of the 1621 records in this Chapter (Table 7.4).

#### **7-B. STUDY AREA**

Location: Township 9S, Range 9W

Area Studied: ?

Habitat(s) Studied: Unknown (probably mixed)

Elevation: 160?-1000? ft (49?-305? m)

Distance to Coastline: >10 mi ? (>16 km ?)

It is unfortunate that the location of these observations is not better known. All were probably within a 3 mi (5 km) radius of the Logsdon Store, and many of them may have been near Llewellyn's home (Fig. 4.1) but were not noted as such in his field notes.

#### **7-C. METHODS**

Llewellyn's observations were made incidentally with or without binoculars. He did not try to make systematic observations, so more birds may have been present than were recorded. He did not record the time of day or duration of his observations.

There were several other observers (Table 7.4), and their observations were also incidentally made. Floyd Schrock had some observations not included in Schrock and Bayer (1994) for the Logsdon area that are not given here because they may have been farther than a 3 mi (5 km) radius from the Logsdon Store.

#### **7-D. TOLERABLE OBSERVATION EFFORT (TOE)**

The term Tolerable Observation Effort (TOE) is used to emphasize that if certain criteria are attained, effort is judged Tolerable (i.e., moderately good or passable), so that observations can be considered as presence/absence data, not just as presence data (Bayer 1993:14-15).

Because these observations were incidentally made and observation effort was variable (Table 7.1), none of these months are classed as TOE.

#### **7-E. SHORTCOMINGS OF OBSERVATIONS**

##### **7-E-1. INTRODUCTION**

In any ornithological undertaking there are shortcomings, and this is no exception. Many possible shortcomings are examined in Bayer (1993:28-31); here, only the most relevant ones are examined.

##### **7-E-2. SHORTCOMING: IMPRECISE STUDY AREA**

It would have been much more informative if the exact location of these observations was known, so that these records could be attributed to a much smaller, more defined area.

##### **7-E-3. SHORTCOMING: OVERLOOKING SPECIES**

Because observers did not attempt to systematically record all species, many may have been missed, particularly shy or inconspicuous species. Further, observers may also have consistently recorded species with which they were familiar and overlooked unfamiliar species.

##### **7-E-4. SHORTCOMING: LOW OBSERVATION EFFORT**

Observers made few or no observations during many months, particularly during August-November (Table 7.1). Thus, the seasonality of many bird species is not as clear as it would have been if there had consistently been three or more observations/month. Because of the usually low observation effort, these records are best considered as presence data, not presence/absence data (Bayer 1993:14-15).

##### **7-E-5. SHORTCOMING: ERRORS IN DETERMINING FIRST AND LAST DATES**

Dates when an observer first or last reported a species are given, if available. However, species may have been present before the First date or after the Last date because observation

effort was not daily and often may not have been long enough to detect all passing migrants. The accuracy of First and Last dates is examined in detail in Faxon and Bayer (1991:29-31).  
\*\*\*\*\*

#### 7-F. GENERAL RESULTS AND DISCUSSION

##### 7-F-1. NUMBER OF TAXA

Few taxa were usually recorded each observation, and the most ever reported was 26 in April 1985 (Table 7.1). The average number of taxa/observation was usually less than 10 (Table 7.1).

The range in the maximum number of taxa noted each month was 11-36, and the range in total taxa/month for all years was 20-59 (Table 7.2). Because of low observation effort during August-November (Table 7.1), it is unclear if there were any seasonal trends in the number of taxa/month, although there appears to be at least one peak in April/May.

There was a total of 108 taxa, with a range of 8-65 taxa/year (Table 7.2). The greatest number of species was recorded in 1984--the year with the greatest number of observation days and total records (Tables 7.1 and 7.2).

17 taxa were waterbirds, and 53% of these were noted in only one or two of the years with many observations (Table 7.3). In contrast, 39% of the 88 terrestrial bird taxa were recorded in only 1-2 years (Table 7.3).

The species recorded in each year with many observations included Turkey Vulture, American Kestrel, Rufous Hummingbird, Northern Flicker, Steller's Jay, American Crow, American Robin, Rufous-sided Towhee, Song and White-crowned sparrows, Dark-eyed Junco, and Purple Finch (section 7-G).

##### 7-F-2. NESTING SPECIES

Species with adults at a nest, with nestlings, or with fledged or nonfledged young still receiving parental care include Hooded Merganser, Barn Swallow, American Crow, Black-capped Chickadee, Bushtit, American Robin, Hermit Warbler, and House Finch (section 7-G). But searches for nests may have revealed that other species may have also nested, since they were often present during the nesting season (section 7-G).

##### 7-F-3. FALL PASSERINE MIGRATION WAVES

In August, there was sometimes a major movement of migrating passernines near Logsdon, similar to what was reported at Thornton Creek (Faxon and Bayer 1991:31-32, 1993:78-80).

Floyd Schrock reported that on 13, 20, and 21 August 1983, there were many Hermit, Townsend's,

Black-throated Gray and Wilson's Warblers, as well as intermittent Brown Creepers, Western Tanagers, Nashville Warblers (8/21), and Solitary Vireos.

Bob Llewellyn noted large concentrations of swallows on 15 and 16 August 1989 and 12 September 1990 (sections 7-G-54 and 7-G-57) that may be related to migration.  
\*\*\*\*\*

#### 7-G. TAXA ACCOUNTS

##### 7-G-1. YEARS WITHOUT RECORDS

A year may be listed for a taxon even though the taxon was not recorded that year. This is done to make it clearer that a taxon was not found every year. Years of absence are given particularly for taxa that are present nearly every year.

##### 7-G-2. FIRST AND LAST DATES

These are the first and last dates, respectively, that a taxon was recorded. Note that a taxon may have been present before a First or after a Last date (Faxon and Bayer 1991:29-31). A First or Last date is only listed if there appears to be enough observations to somewhat accurately determine the date.

=not possible to assign a First or Last date because the bird taxon was present continually or erratically throughout the year, because observation effort may have been inadequate to determine the First or Last date reasonably accurately, or because the date was not recorded.

##### 7-G-3. SEMIMONTHLY FREQUENCY

A.=taxon recorded in the first part (1-15th) of a month; it wasn't noted later that month.  
Z=taxon recorded from the 16th to the end of a month; it wasn't noted earlier that month.  
AZ=taxon recorded during both portions (1-15th and 16th-end) of a month.  
PP=taxon recorded sometime during the month.  
?=taxon not recorded during a month. It is not possible to determine if the absence is from low observation effort or the absence of the taxon.

##### 7-G-4. AVERAGE MONTHLY FREQUENCY

AV MONTH. FREQ=average monthly frequency of occurrence of a taxon (e.g., Bayer 1993:20).  
+=taxon recorded during one month.  
X=taxon recorded during two or more months.  
?=the taxon was not recorded but there were no observations or observation effort may have been inadequate to detect it.

AV MONTH. FREQ + ? X X X ? + ? ? + + ?

Only one was seen at a time.

Because the sex ratio of harriers found here appears to be skewed, the plumage for each record is given (if known) in the following tabulation (M=adult male [gray], F=female or immature male [brown], UNK=unknown):

Number & Plumage Type.....

Date	M	F	UNK	Date	M	F	UNK
3-25-82	.	.	1	1-14-89	1	.	.
4-25-84	.	1	.	3-17-89	1	.	.
3-15-85	.	.	1	5-5-90	1	.	.
4-21-85	.	.	1	5-2-91	1	.	.
10-16-86	.	.	1	5-19-91	1	.	.
4-2-87	.	.	1	5-26-91	1	.	.
7-14-87	.	1	.	11-3-91	.	.	1

Sum M=6, F=2, UNK=6

Note that even if all unknown birds were brown (which is unlikely) that the ratio would only slightly favor the brownish birds. All of these were seen by Bob Llewellyn, who reported a similar ratio favoring adult males at his home (section 4-G-11). These results are in marked contrast to South Beach Peninsula, where only four of 26 harriers were adult males (Bayer 1991:15).

This species was rare here.

In 1985, Floyd Schrock observed a nest in a shrub growing next to the Logsdon Mennonite (now Neighborhood) Church (which is along HWY 410, about a mile west of the Logsdon Store) with five eggs on June 9, and he noted that young were being fed at the nest on June 23. In 1986, he noted that eggs hatched at a nest in the same bush as in 1985 on April 27.
