### Abstract

Oregon State University installed and recovered moorings along the coast of Peru during the period late March 1976 through mid-May 1977. A mid-shelf mooring near 15°S (MILA) was maintained for the full duration of the experiment, through five successive installations. This site was complemented by six other moorings in the first half of 1976 and by nine in the March-April-May 1977 period. These simultaneous moorings were arranged in onshore-offshore arrays near 15°S and in alongshore arrays at midshelf from 10°S to 15°30'S.

The data described in this report consists of the hourly processed and filtered values of wind and current velocity, air and water temperature, and pressure from the 1976-1977 Peru installations. We describe the data through installation summaries, statistics tables, progressive vector diagrams, speed and direction histograms, rotary spectra and time series plots.

## Introduction

An interdisciplinary experiment called JOINT II was conducted in the coastal upwelling region off the Peru coast from late March 1976 through late May 1977. This experiment was the culmination of a series of field efforts carried out in various upwelling regions (Oregon, Baja California, Northwest Africa) as part of the NSF International Decade of Ocean Exploration Coastal Upwelling Ecosystems Analysis Program (CUEA). The Program goal is to understand the coastal upwelling ecosystem well enough to predict its response far enough in advance to be useful to mankind. The JOINT II effort contributes to this goal by extending the range of natural conditions observed in coastal upwelling systems.

This report is concerned with data from the Aanderaa current meters and meteorological data loggers installed during JOINT II by Oregon State University (OSU, Corvallis). Compilations of JOINT II hydrographic data for 1976 have been prepared by Codispoti et al. (1976), Barton (1977) and Huyer et al. (1978). Compilations for 1977 are in preparation.

## The JOINT II OSU Current Meter Program

The JOINT II Aanderaa moorings were set and recovered for five contiguous periods:

Leg I: late March to early May 1976

Leg II: early May to late July 1976

Leg III: late July to 30 September 1976

Leg IV: 30 September 1976 to 4 March 1977

Leg V: early March to mid May 1977

The time and space distribution of the Aanderaa current meter data during the first phase of JOINT II are shown graphically in Figure 1 for Legs I - IV, and in Figures 2 and 3 for Leg V. During Legs I, II and V moorings were arranged in cross-shelf arrays from nearshore to the upper slope and in alongshore arrays at midshelf from as far south as 15°30'S to as far north as 10°S. Intense coverage took place during Legs 1 and 2 from late March through most of July; monitoring of currents at midshelf was continued at 15°S (MILA) through February 1977; and the most intensive measurements were taken during March, April and May, 1977.

Table 1 summarizes the positions, water depths and accepted instrument depths by legs for the JOINT II Aanderaa moorings (only instruments from which data were obtained are included). Several navigation charts were used during JOINT II and their coastlines were found subsequently to be mutually inconsistent. Since most fixes were made by radar references to coastline points, this has created some confusion and inconsistency in geographically relating the moorings to each other, to the bathymetry and to the station positions of research vessels. The problem is discussed in greater detail in Appendix 1, and the charts used for the moorings are noted in Table 1.

All of the moorings were subsurface taut-wire installations as described (in principle) by Pillsbury, Smith and Tipper (1969). Railroad wheels were used for deadweight in conjunction with AMF acoustic releases at the base of each vertical current meter string. Over the continental shelf (250 m or less) flotation was provided by 11" diameter Vinyl floats (above each instrument) and a 29" steel sphere (at the top of each mooring).

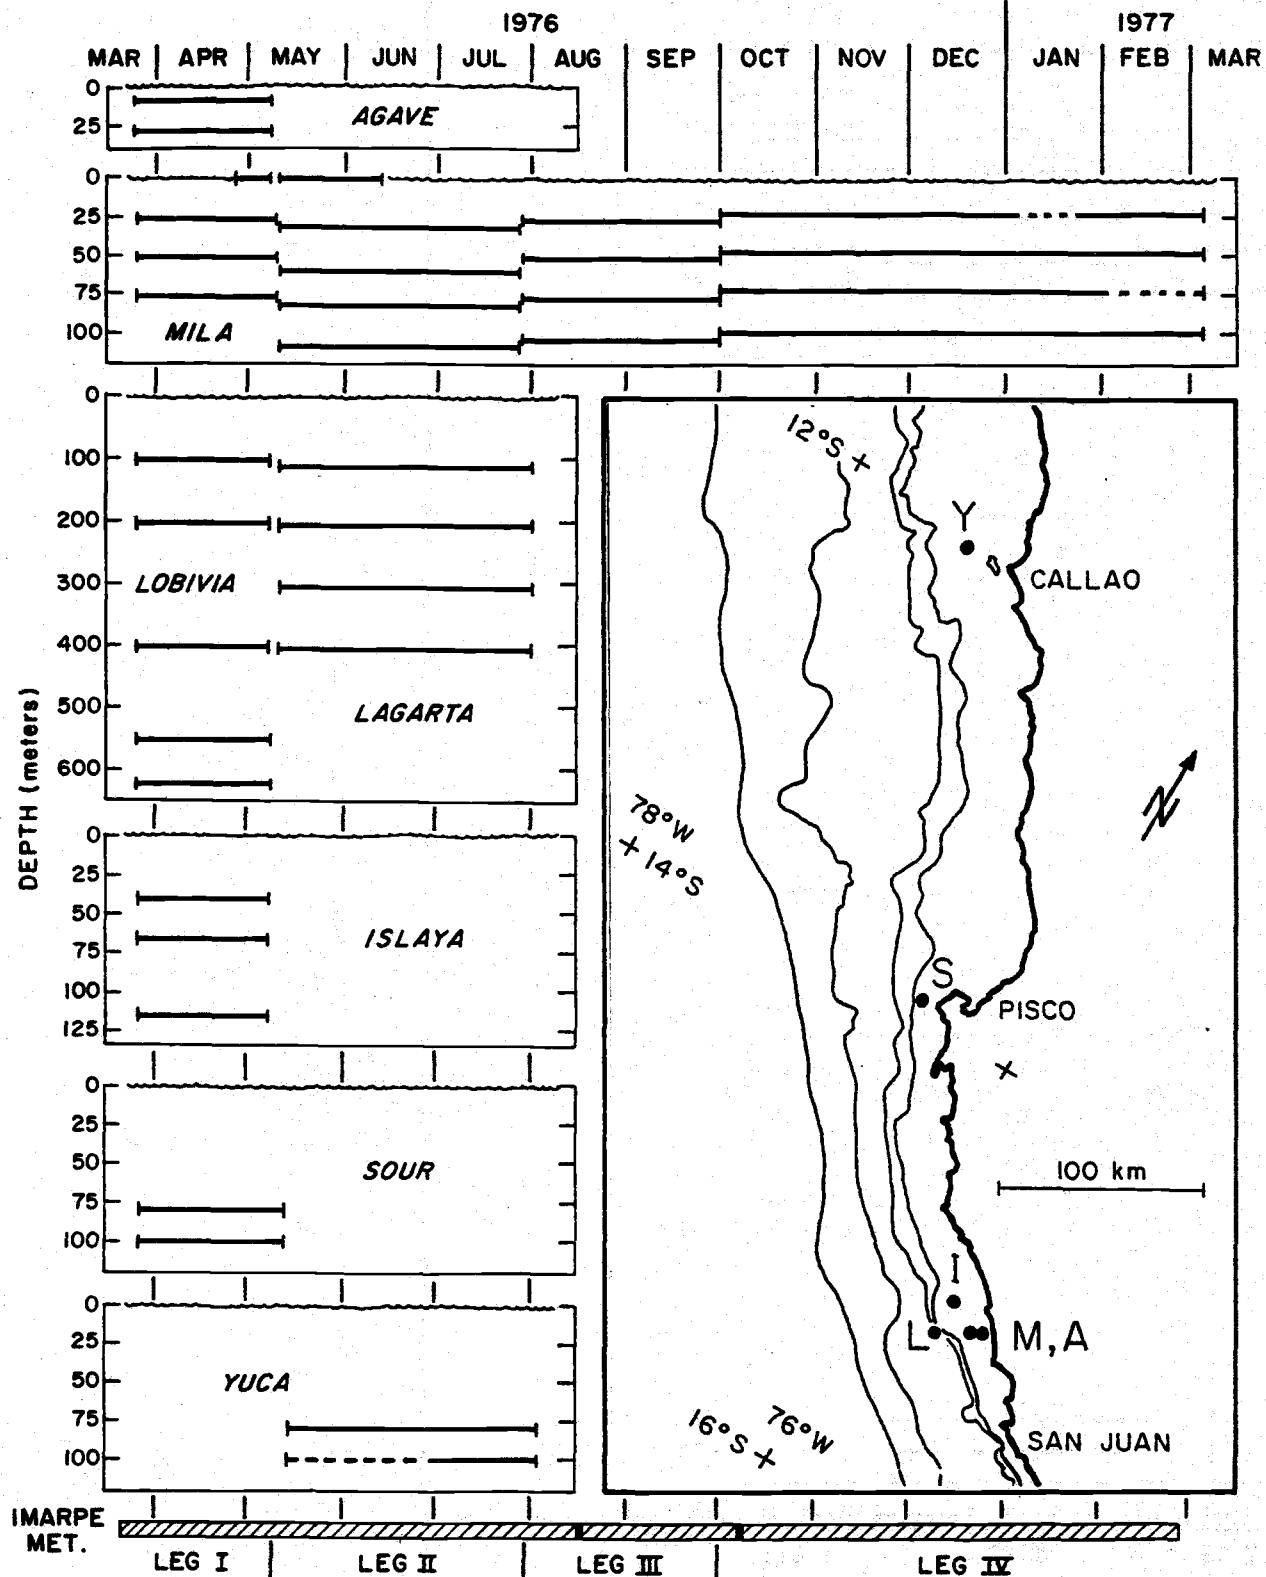

Figure 1. Time-depth distributions of Aanderaa current meter data during JOINT-II from March 1976 to March 1977, and locations of current meter moorings (inset). Lines are dashed where speed and/or direction data are missing. Mooring location symbols are: A-Agave; M-Mila; L-Lobivia and Lagarta; I-Islaya; S-Sour; Y-Yuca.

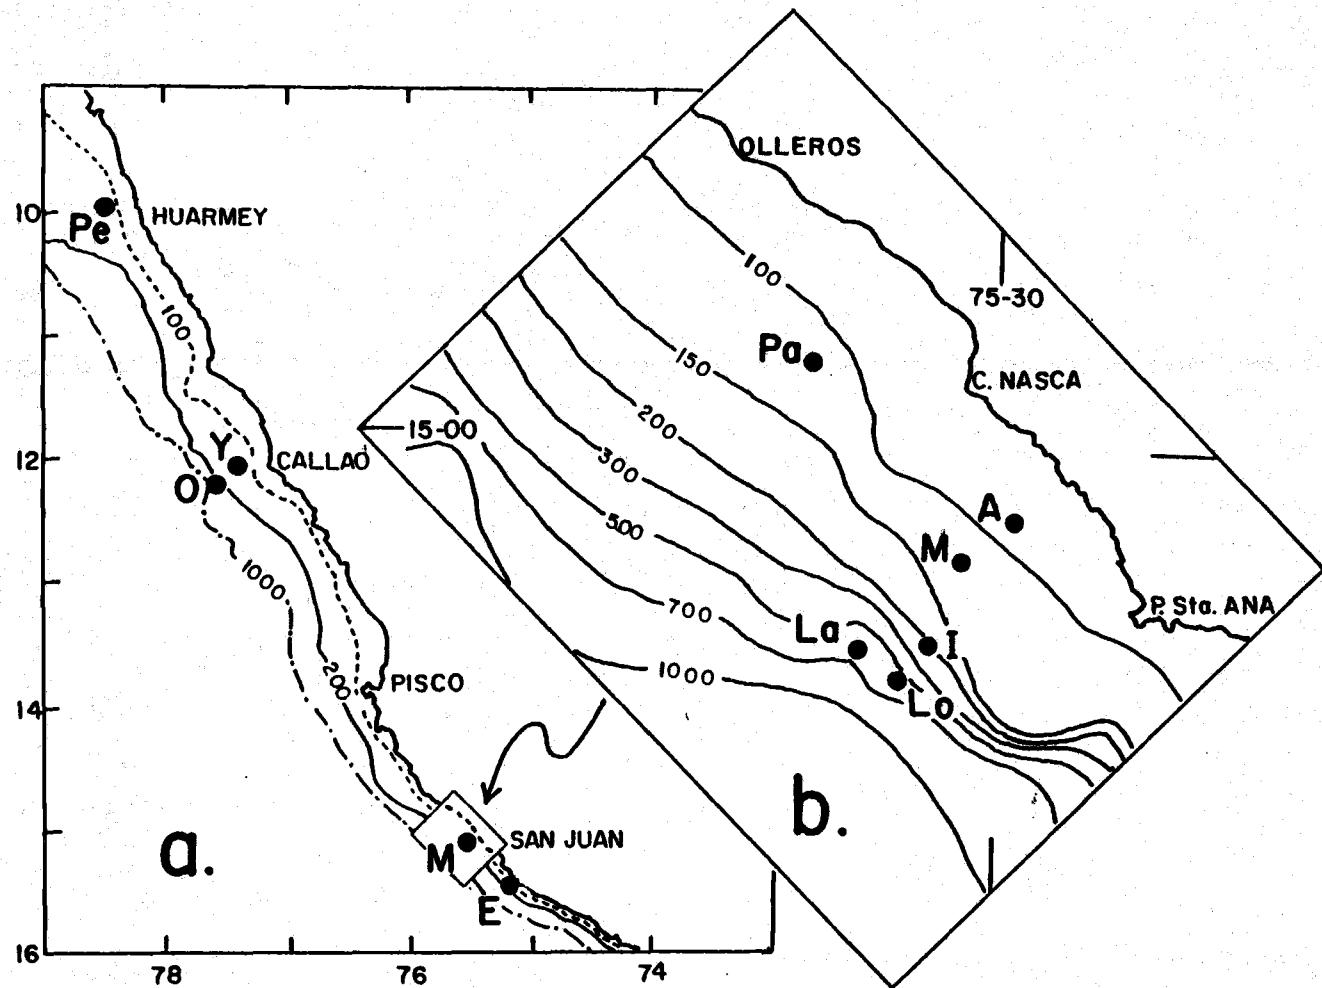

Figure 2. Locations of JOINT II Aanderaa current meter moorings (a) at midshelf in the alongshore directions and (b) near 15°S in the offshore direction, from March through May 1977. Mooring location symbols are: E-Euphorbia; M-Mila; Y-Yucca Too; O-Opuntia; Pe-Peyote; A-Agave; I-Ironwood; Lo-Lobivia; La-Lagarta; Pa-Parodia.

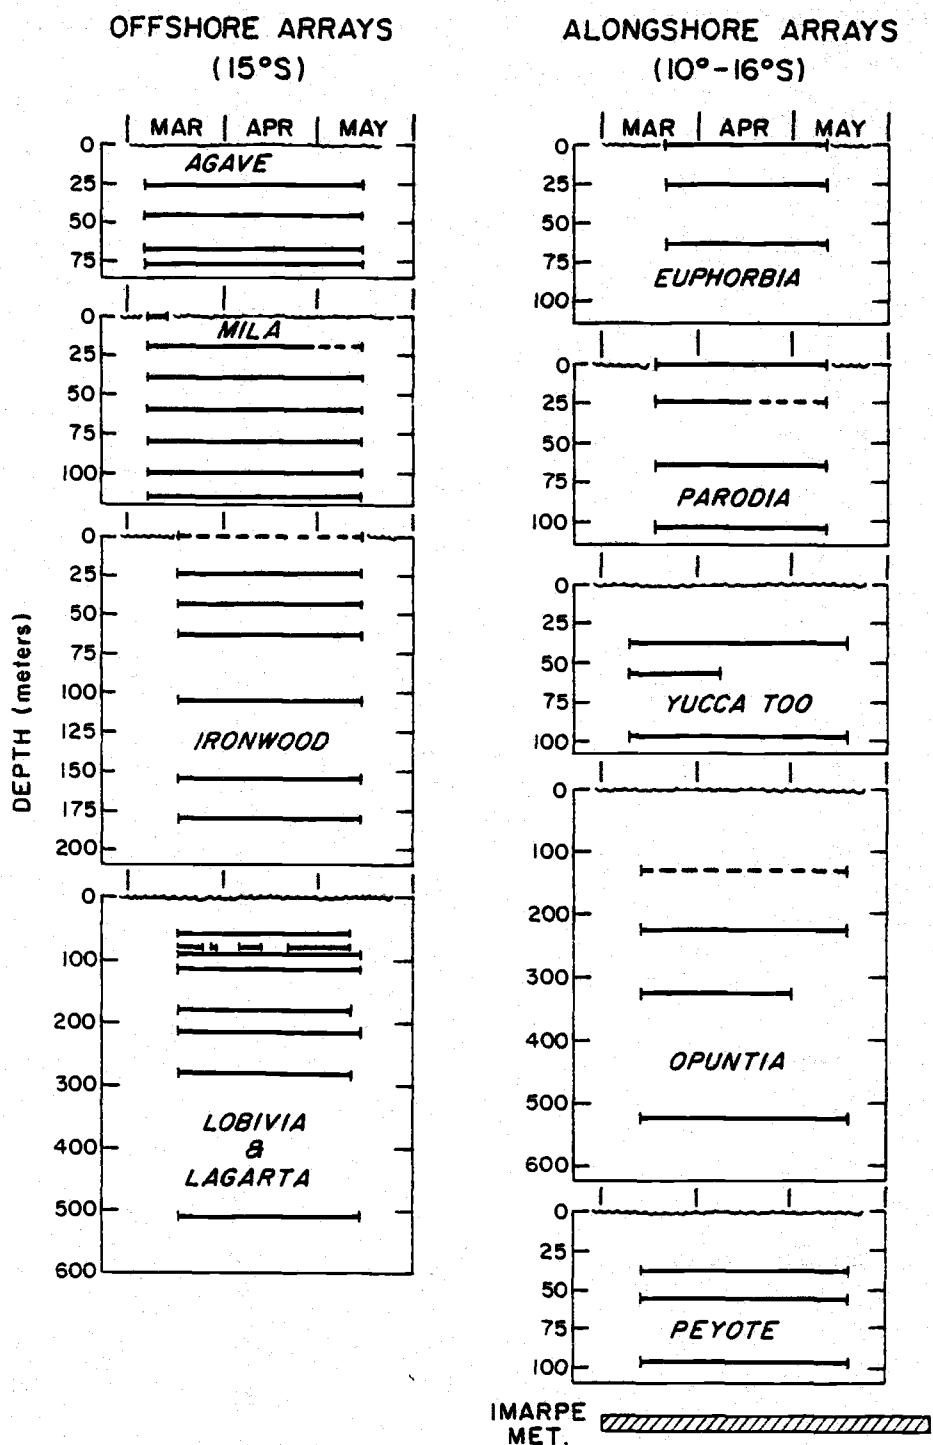

Figure 3. Time-depth distributions of JOINT II Aanderaa current meter data from March through May 1977. Lines are dashed where speed and/or direction data are missing.

Table 1. Summary of positions, water depths and instrument depths for instrument arrays deployed by OSU in JOINT II. The positions of the meteorological buoys (not listed) are given in the installation summaries. Only instruments from which data were obtained are listed.  
M: Meteorological buoy; T: Tide gauge

Moorings deeper than 250 m followed the Woods Hole Oceanographic Institution mooring scheme for intermediate depths (Heinmiller and Walden, 1973) with glass Corning floats for flotation and double acoustic releases.

All of the current meters moored were Aanderaa RCM4's. They recorded temperature, speed and direction at 15, 20, 30 and 60 minute intervals in the manner described by Pillsbury *et al.* (1974). Some current meters also recorded pressure to monitor the mooring motion and the true mean depths of the deployed instruments; a few of the instruments were equipped with conductivity sensors as well.\*

Meteorological buoys were moored at MILA during Leg I and Leg II, and again at MILA, IRONWOOD, LAGARTA, EUPHORBIA and PARODIA during Leg V. Each buoy consisted of a vertical tower with three toroids for flotation. The buoys were tethered to concrete blocks and connected by ground lines to the main anchors of the associated current meter arrays. The buoys were equipped with Aanderaa data loggers which recorded wind speed and direction, air temperature, and water temperature three meters below the surface.

A meteorological tower with an Aanderaa data logger was installed on the roof of the Instituto del Mar del Peru (IMARPE) from May 1976 through part of June, 1977. Wind speed and direction and air temperature were measured. Data segments between servicings correspond approximately to Legs II, III, IV, and V of the current meters.

#### Instrument Recovery and Performance

Twenty-three moorings with a total of 88 RCM's were set during all the phases of JOINT II (Legs I - V). In 1976 a shelf-break mooring near 15°S (not shown) was completely lost (four RCM's), as was the deepest

---

\* The conductivity data have not been fully processed and are not presented in this report.

current meter at MILA (Leg I). In 1977 (Leg V) two moorings (not shown) were completely lost (8 RCM's). The 75 recovered RCM's successfully recorded 95% of the possible water temperature data and 87% of the possible velocity data. The partial data records (no velocity) are indicated by dashed time-lines in Figures 1 and 2. Table 2 summarizes the data losses due to and causes of partial or complete instrument failures.

The data logger was replaced at the MILA meteorological buoy during Leg I. The first data logger recorded no data during a four week period, and the second one recorded satisfactorily for the remaining 13 days of the Leg I current meter mooring. The Leg II buoy tore free from its tether about mid-June 1976.\* Thirty-seven days of data were recorded prior to breakaway (which was determined from the changed behavior of the buoy orientation sensor).

#### Calibration

When Aanderaa instruments were first acquired by Oregon State University, they were subjected to tests to evaluate sensor stabilities. The initial results (Pillsbury *et al.*, 1974) and subsequent experience indicate that speed and direction sensors, if not obviously damaged, are stable in time and adhere reasonably well to the manufacturer's specifications. Current meter thermistors exhibit (at most) a slight linear drift with time, correctable through successive calibration. Pressure and conductivity must be kept in calibration.

In-house calibration procedures have been developed by OSU (Pillsbury *et al.*, 1974) and the direction, temperature and pressure

---

\* A Peruvian fisherman found it beached just south of the river mouth at Rio Ica, northwest of Cabo Nazca ( $15^{\circ}\text{S}$ ).

Table 2. Data losses due to instrument failures or fouling, and causes.

Station	Leg	Depth (m)	Days Lost	Cause	Affected Channels

Opuntia	V	129	66.3	compass failure	$\theta$
Opuntia	V	324	17.7	battery failure	$S, \theta, T$
Yucca Too	V	57	40.8	tape encoder malfunction	$S, \theta, T$

 $S_w, \theta_w$ : wind speed, direction $S, \theta$ : current speed, direction $T, Ta$ : water and air temperature $P, C$ : pressure, conductivity

sensors are usually calibrated between major experiments (i.e. at about 1-2 year intervals). Undamaged and unfouled rotors are assumed to measure speed correctly within the manufacturer's limits (calibration is considered redundant and impractical). Appendix 2 presents a discussion of the status of water temperature calibrations for the JOINT II Aanderaa current meters and buoys.

#### Processing and Description of the Data

The data described in this report were first read from the Aanderaa magnetic tapes and preliminary plots and statistics generated to aid in error detection. The data recorded at 15, 20 or 30 minute intervals (Legs I - III, V) were low passed so as to preserve information at tidal and smaller frequencies, while reducing point-to-point scatter. The low passed data were then decimated to hourly values. The details of the data processing are discussed by Pillsbury et al. (1974). Due to the long duration of the Leg IV mooring at MILA, the data were recorded at a one hour sampling interval and were not filtered.

The descriptive materials in this report are ordered depthwise from top to bottom in a separate section for each mooring; the mooring sections are ordered by leg, offshore distance and south-to-north distance, respectively. The header page for each mooring section summarizes information about the position, offshore distance, bottom depth, and intervals for each mooring installation. A short table lists pertinent information about the instruments with columns as follows:

Intended Depth: based on mooring wire lengths and the intended bottom depth.

Accepted Depth: based on mooring wire lengths and the mean depth(s) of one or more instruments as given by pressure sensors.

Serial/Tape Number: serial number assigned by the manufacturer and the sequence number of the magnetic tape recorded by the instrument (thus, 485/10 is the tenth tape recorded by machine #485).

Measured variables:  $S$ ,  $\theta$  = current speed and direction;  $S_w$ ,  $\theta_w$  = wind speed and direction;  $T$ ,  $T_a$  = water and air temperature;  $P$ ,  $C$  = pressure and conductivity

A section for comments provides specific information (if any) about malfunctions and/or the duration, kind and quality of data subsets.

Following the header page is a figure with the progressive vector diagrams (PWD's) for the current meters in the mooring. Each current meter in turn is described by a statistics table; a figure with histograms of speed and direction and the rotary spectrum; and a figure with time series of onshore ( $u$ ) and alongshore ( $v$ ) velocity components, temperature and pressure (if any).

The PVD's represent pseudo-trajectories referred to East-West and North-South axes, in kilometers. Each dot on a PVD refers to 0000 GMT on the corresponding day. Information given in the summary tables can be used to assign dates to the dots, if necessary.

The statistics tables give the following types of information:

Header: identification, time interval, filtering.

First/Last 5 Lines: line image listing of first and last five lines of the data file, to illustrate the format.\*

Statistics for E-W (U) and N-S (V) velocity components: velocities are taken as positive toward the East (U) and North (V).

Vector mean speed and direction

Directional steadiness: the ratio of the vector mean speed to the scalar mean speed, i.e. the current stability of Neumann (1968).

Principle axis (of variation): given as a compass direction ( $^{\circ}T$ ).

Statistics for rotated data: the velocity components are rotated into the onshore/alongshore coordinate system as defined by the JOINT II hydrographic sections, and basic statistics are given for scalar speed, onshore velocity (U), alongshore velocity (V, positive toward NW), temperature (T), and pressure (P, if any).

The rotary spectra were computed when the length of a time series permitted, and are presented with the histograms. The rotary spectrum was generated from the hourly velocity components (E-W and N-S), typically for a 2 or 3 month period. The series were divided into detrended segments (usually two), raw spectral estimates were computed for each segment, and the results were hanned (once). The procedure was modified according to record length so as to consistently induce about 10 degrees of freedom. Rotary spectra and their interpretation are discussed by Gonella (1972), Mooers (1973) and O'Brien and Pillsbury (1974).

---

\* These normally give GMT hour, date, month, year, east-west velocity (U), north-south velocity (V), cumulative velocities ( $\Sigma u$ ,  $\Sigma v$ ), water temperature (T), pressure (P) and conductivity (C). Units are: U, V (cm/sec for currents, m/sec for wind); T ( $^{\circ}$ C); P (pascals); C (mmhos). The actual format will vary depending on the data channels recorded by the instrument.

The time series plots are grouped by instruments. These figures give the onshore and alongshore velocity components, temperature, and pressure (if any) with time. Abcissa tics are at 0000 GMT on each day (the first day of each month is indicated).

#### ACKNOWLEDGMENTS

We gratefully acknowledge the support for this program which came from the National Science Foundation grant OCE 76-00132. The field program was managed by *R. Still* with the aid of *B. Moore*; *D. Barstow* and *B. Moore* were principally responsible for the calibration; maintenance and preparation of the instruments; and *J. Bottero* and *D. Root* processed the data. Our special thanks and recognition go to these people for their indispensable assistance.

Instrumentation

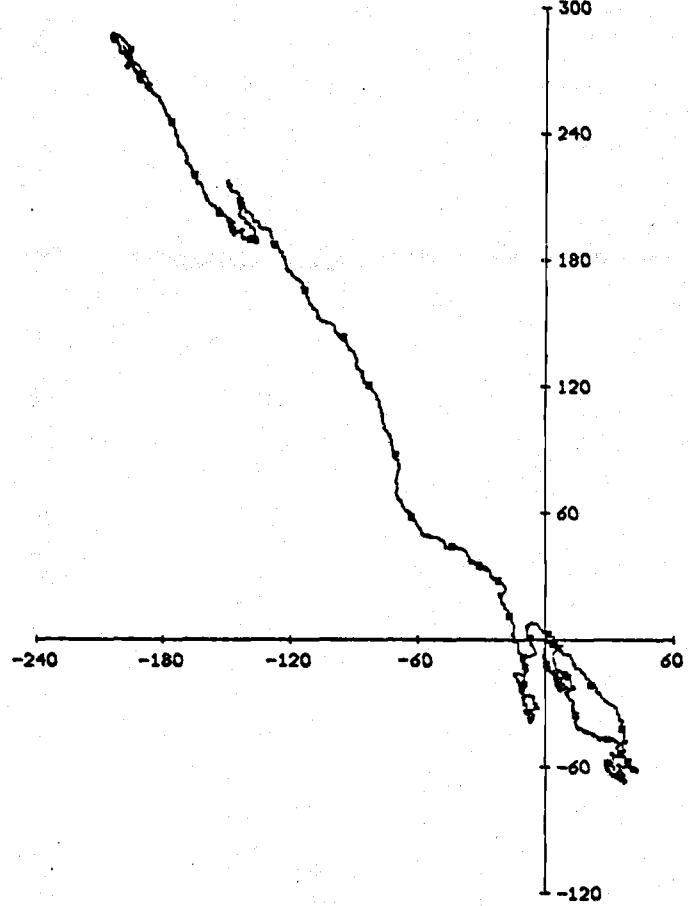

<u>Intended Depth</u>	<u>Accepted Depth</u>	<u>Serial Tape #</u>	<u>Sampling Interval</u>	<u>Measured Variables</u>
20 m	10 m	687/20	30 min	S,θ,T,P,C
40 m	29 m	501/35	30 min	S,θ,T,P

Comments:

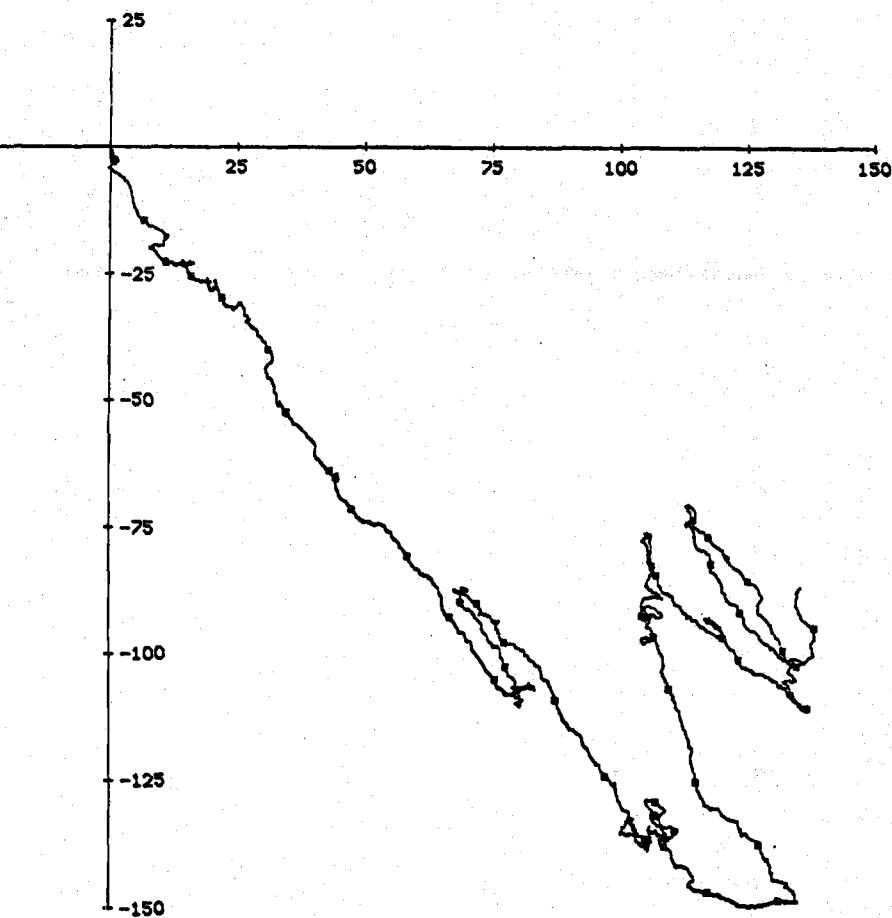

The mooring position (above) was determined when deck work started. By the time of anchor release (set time) the R/V ALPHA HELIX had drifted considerably shoreward but a new position was not logged. Accounts of observers suggest that the ship was about one kilometer offshore when the installation was completed.

## MILA I

Position\*:  $15^{\circ}05.1'S$ ,  $75^{\circ}31.4'W$   
 Distance Offshore: 12.0 km  
 Bottom Depth: 123 m  
 Set: 1351 GMT 25 March 1976 by R/V ALPHA HELIX  
 Retrieved: 1533 GMT 9 May 1976 by R/V THOMPSON  
 Longest Data Interval: 1700 GMT 25 March to 1300 GMT 9 May  
 Longest Record Length: 44 days, 21 hours

Instrumentation

Intended Depth	Accepted Depth	Serial Tape #	Sampling Interval	Measured Variables
0 m	0 m	D126/8	20 min	$S_w, \theta_w, T_a, T$
25 m	28 m	752/21	20 min	$S, \theta, T, P, C$
50 m	53 m	486/29	30 min	$S, \theta, T$
75 m	78 m	490/27	30 min	$S, \theta, T$

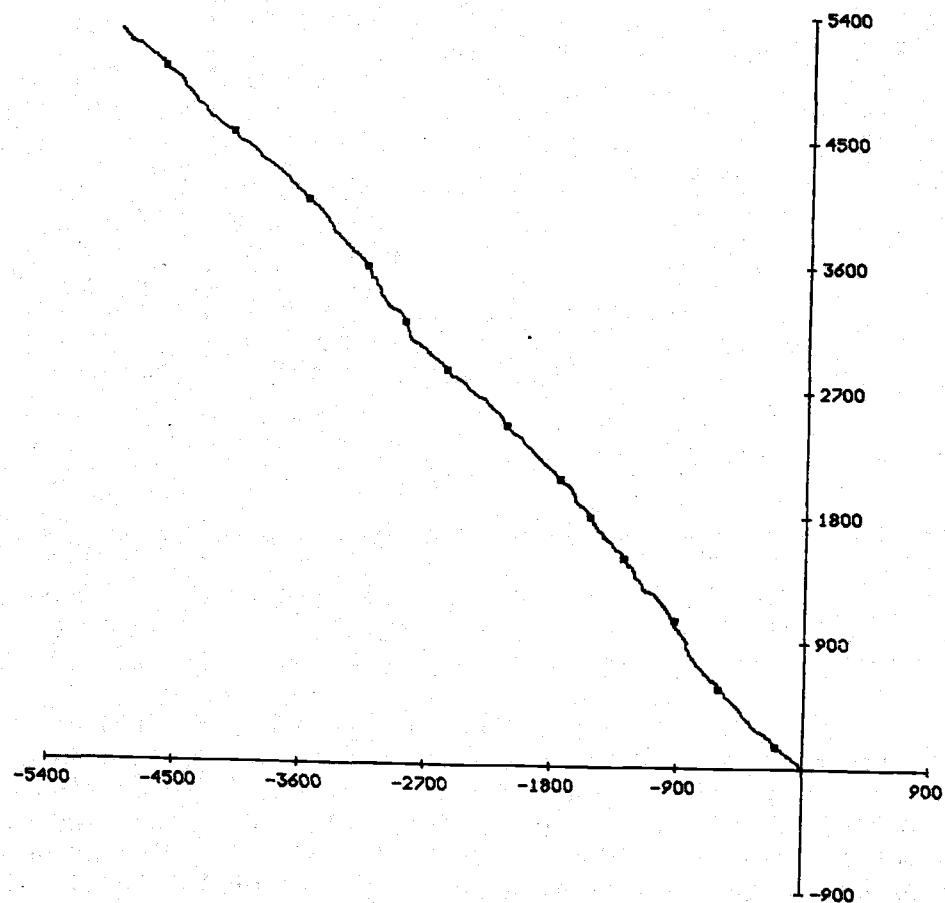

Comments:

The met buoy at MILA was serviced on 26 April, data logger D129 being replaced by D126. While the latter recorded satisfactorily for the remaining  $12\frac{1}{2}$  days of the mooring, the data from D129 was unusable due to a clock failure. The current meter near 100 meters was lost on retrieval (fouled in the screw of the R/V THOMPSON).

RCM 490 was installed with the clock cycling every 30 minutes. When it was recovered the instrument was cycling at 60 minute intervals. Processing was done assuming that the interval changed from 30 to 60 minutes at a single point and remained at 60 for the remainder of the record. This timing change point was chosen so that the in situ period agrees with the number of cycles on the data tape and occurs at 0521 2 April. The 30 minute section was decimated to every other point and combined with the 60 minute portion to create a single raw file with  $\Delta t = 60$  minutes.

---

\* Navigation: radar fixes and German chart DHI-721. The position of the MILA I meteorological buoy was estimated to be within  $\frac{1}{2}$  n.m. of the subsurface array.

Comments:

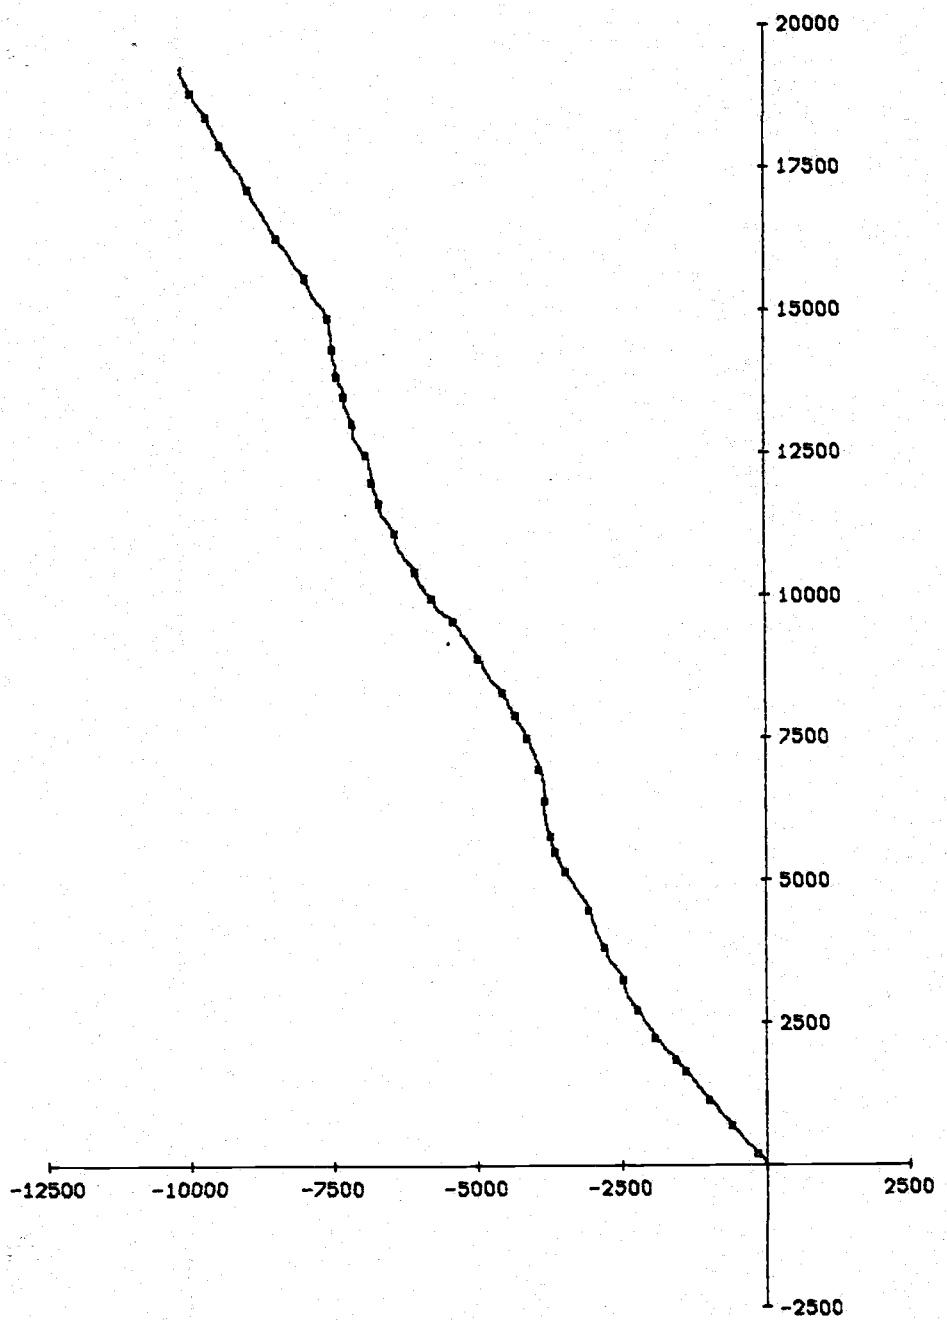

MILA II was equipped with a meteorological buoy (D124) which apparently tore loose from its mooring during a period of strong winds. A local fisherman discovered the buoy on the beach just south of the Ica River mouth, and personnel from the Pisco fisheries (IMARPE) laboratory recovered it. The data from the buoy orientation sensor clearly indicated when the buoy began to drift, therefore 37 days of data were salvaged. The mean direction for the MILA II wind record was more onshore than for the shorter MILA I record, but the vector mean directions are similar for the several-day periods before and after the buoy was serviced (see the PVD's). The MILA II water temperature (3 m) did not agree with the pre-calibration and is about 1.1°C cooler than the hydrographic (CTD) observations at the beginning, and about 1.9°C cooler at the end of the record. The data were not corrected. The CTD values are included on the time series plot for comparison.

---

\* Navigation: Satellite navigator. The position of the MILA II meteorological buoy was estimated to be within  $\frac{1}{2}$  n.m. of the subsurface array.

Position\*:  $15^{\circ}06.0'S$ ,  $75^{\circ}30.2'W$   
 Distance Offshore: 11.5 km  
 Bottom Depth: 119 m  
 Set: 1433 GMT 30 September 1976 by R/V EASTWARD  
 Retrieved: 1046 GMT 4 March 1977 by R/V MELVILLE  
 Longest Data Interval: 1700 GMT 30 September to 0800 GMT 4 March  
 Longest Record Length: 154 days, 16 hours

Instrumentation

Intended Depth	Accepted Depth	Serial Tape #	Sampling Interval	Measured Variables
25 m	23 m	751/20	60 min	S,θ,T,P
50 m	48 m	1962/3	60 min	S,θ,T
75 m	73 m	1964/3	60 min	S,θ,T
100 m	99 m	503/34	60 min	S,θ,T,P

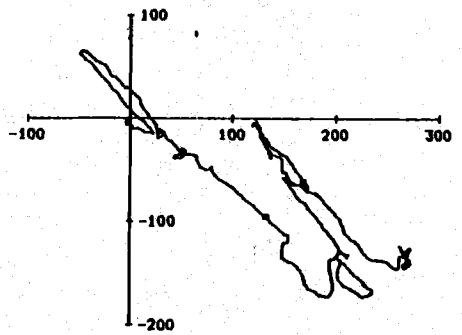

Comments:

Due to a sensor malfunction on current meter 751 (23 m), speed and velocity components were zeroed out of the data record in two places. The two periods for which current data exist are from 1700 GMT 30 September 1976 through 1000 GMT 4 January 1977 (95 days, 18 hours) and from 0900 GMT 23 January through 0600 GMT 3 March 1977 (38 days, 22 hours).

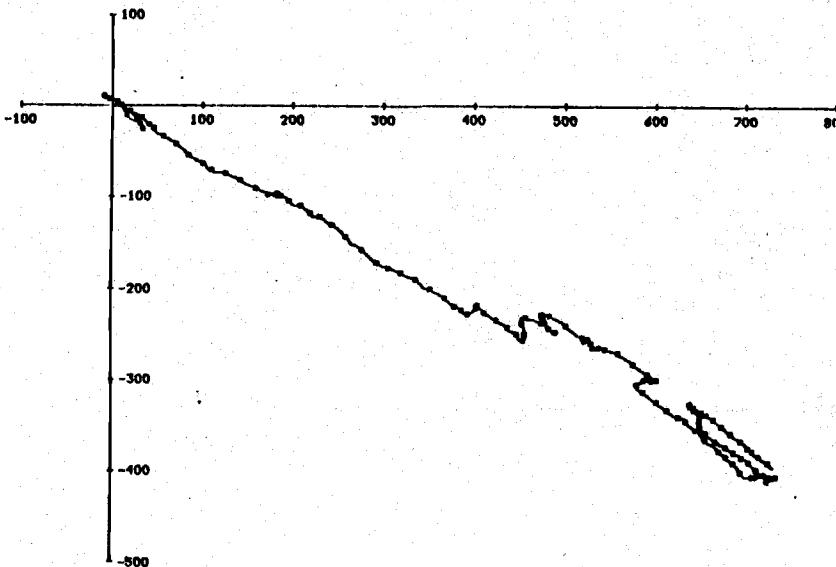

Due to fouling of the savonius rotor, data for speed and velocity components don't exist for current meter 1964 (73 m) after 2300 GMT 2 February 1977.

Comments:

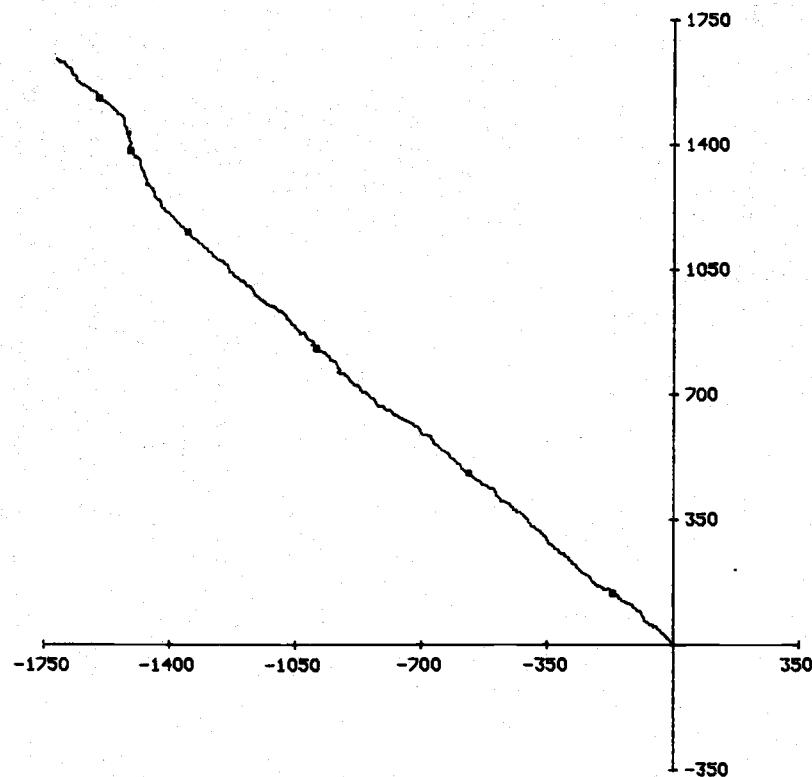

The meteorological buoy data logger (D167) leaked after the first six days of the installation and the subsequent record was not usable.

Slowing of the rotor on RCM 687 (19 m) due to heavy fouling was apparent by 1 May 1977. Speed and component velocities were accepted through 00 GMT 30 April, and zeroed out of the record thereafter. The gearbox and speeds were such that 1/3 - 1/2 of the remaining speed observations had to be linearly interpolated.

---

\* Navigation: radar fixes and Peru chart DHNM 2200. The position of the MILA V meteorological buoy was estimated to be 15°05.5'S 75°29.7'W.

Comments

No acceptable direction data exist for the Ironwood meteorological buoy (D124) due to failure of the buoy orientation sensor. The data from the buoy water temperature sensor did not agree with pre- and post-calibrations. Temperatures from CTD casts (at 3 m) are drawn on the time plots for comparison.

About 10% of the temperature data in the 1968/6 record were erroneous and were replaced by linear interpolation.

---

\* Navigation: radar fixes and Peru chart DHNM 2200. The position of the meteorological buoy was estimated to be 15°09.0'S 75°32.9'W.

Comments:

The meteorological buoy at Lagarta (D128) was set 9 days earlier than the current meters, on 6 March 1977. Speed and water temperature were satisfactorily recorded for 69 days, but no acceptable data were recorded for direction and air temperature. The data from the buoy water temperature sensor did not agree with pre- and post-calibrations. The data from D128/7 have been kept for possible future use but are not considered reliable in their present form and are not described in this report.

Current meter 1242 was placed at an accepted depth of 313 m (intended depth = 300 m) but no intelligible data could be read from the tape.

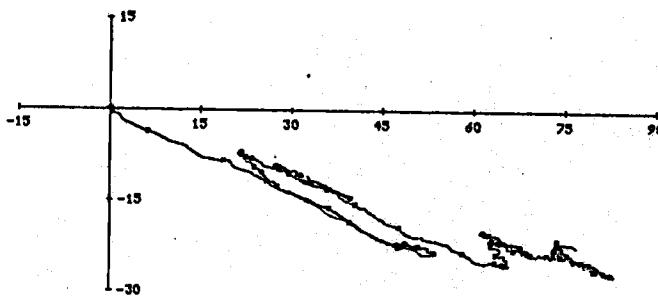

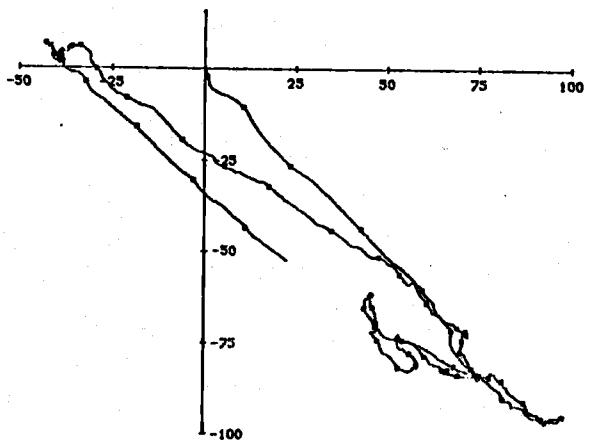

---

\* Navigation: radar fixes and Peru chart DHNM 2200. The position of the Lagarta V meteorological buoy was estimated to be 15°10.8'S 75°35.2'W.

Comments:

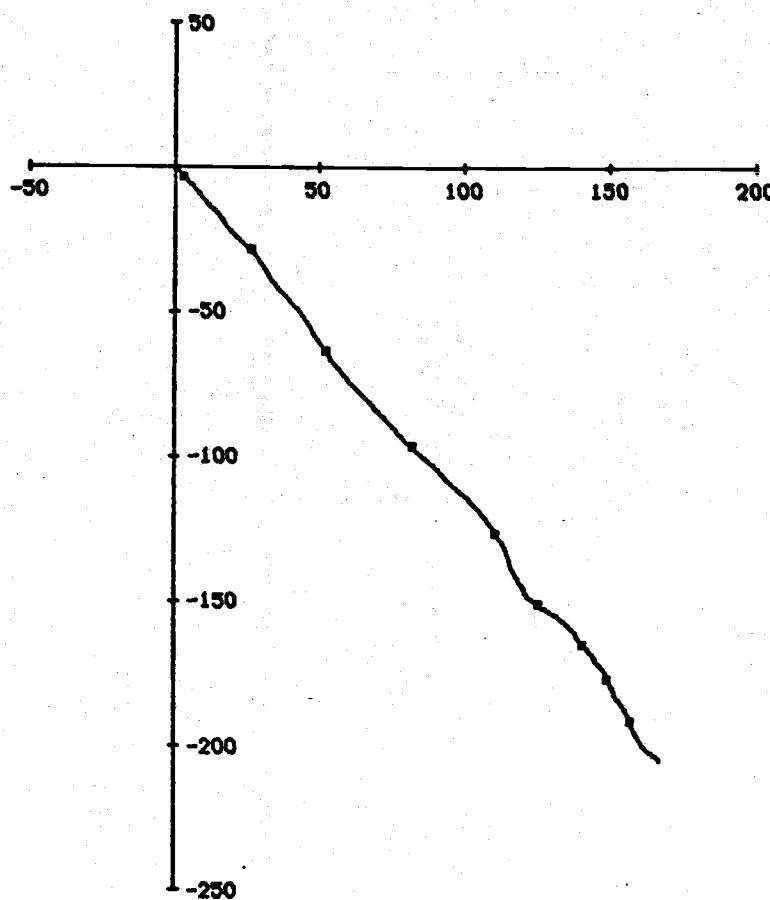

The data from RCM 749 were of mixed quality, and three extensive sections were eliminated, leaving the following four segments of data:

1. 0300 GMT 16 March through 1700 GMT 24 March (8 days, 15 hours)
2. 0500 GMT 27 March through 1200 GMT 28 March (1 day, 8 hours)
3. 1200 GMT 5 April through 0400 GMT 12 April (6 days, 17 hours)
4. 1600 GMT 21 April through 1100 GMT 11 May (19 days, 20 hours)

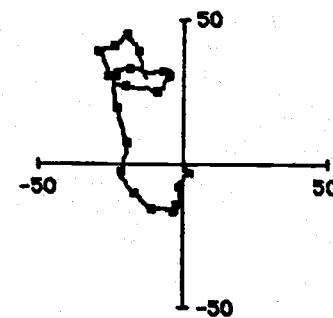

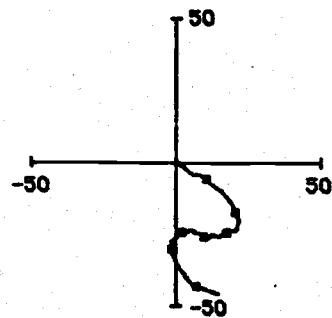

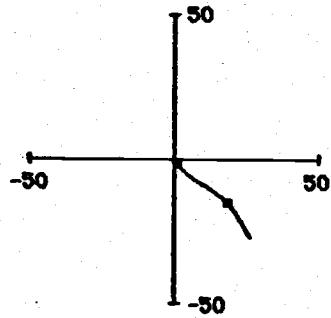

Current meter 1245 was placed at an accepted depth of 383 m (intended depth = 350 m) but no intelligible data could be read from the tape.

**IMARPE Meteorological Installation**

## JOINT-II 1976/1977 Installations

Meteorological Tower  
IMARPE

Position: 12°03.9'S, 77°09.3'W

Location: On a guyed tower 3 m above the roof of a building  
in Callao, Peru.

Sampling Interval: 20 minutes.

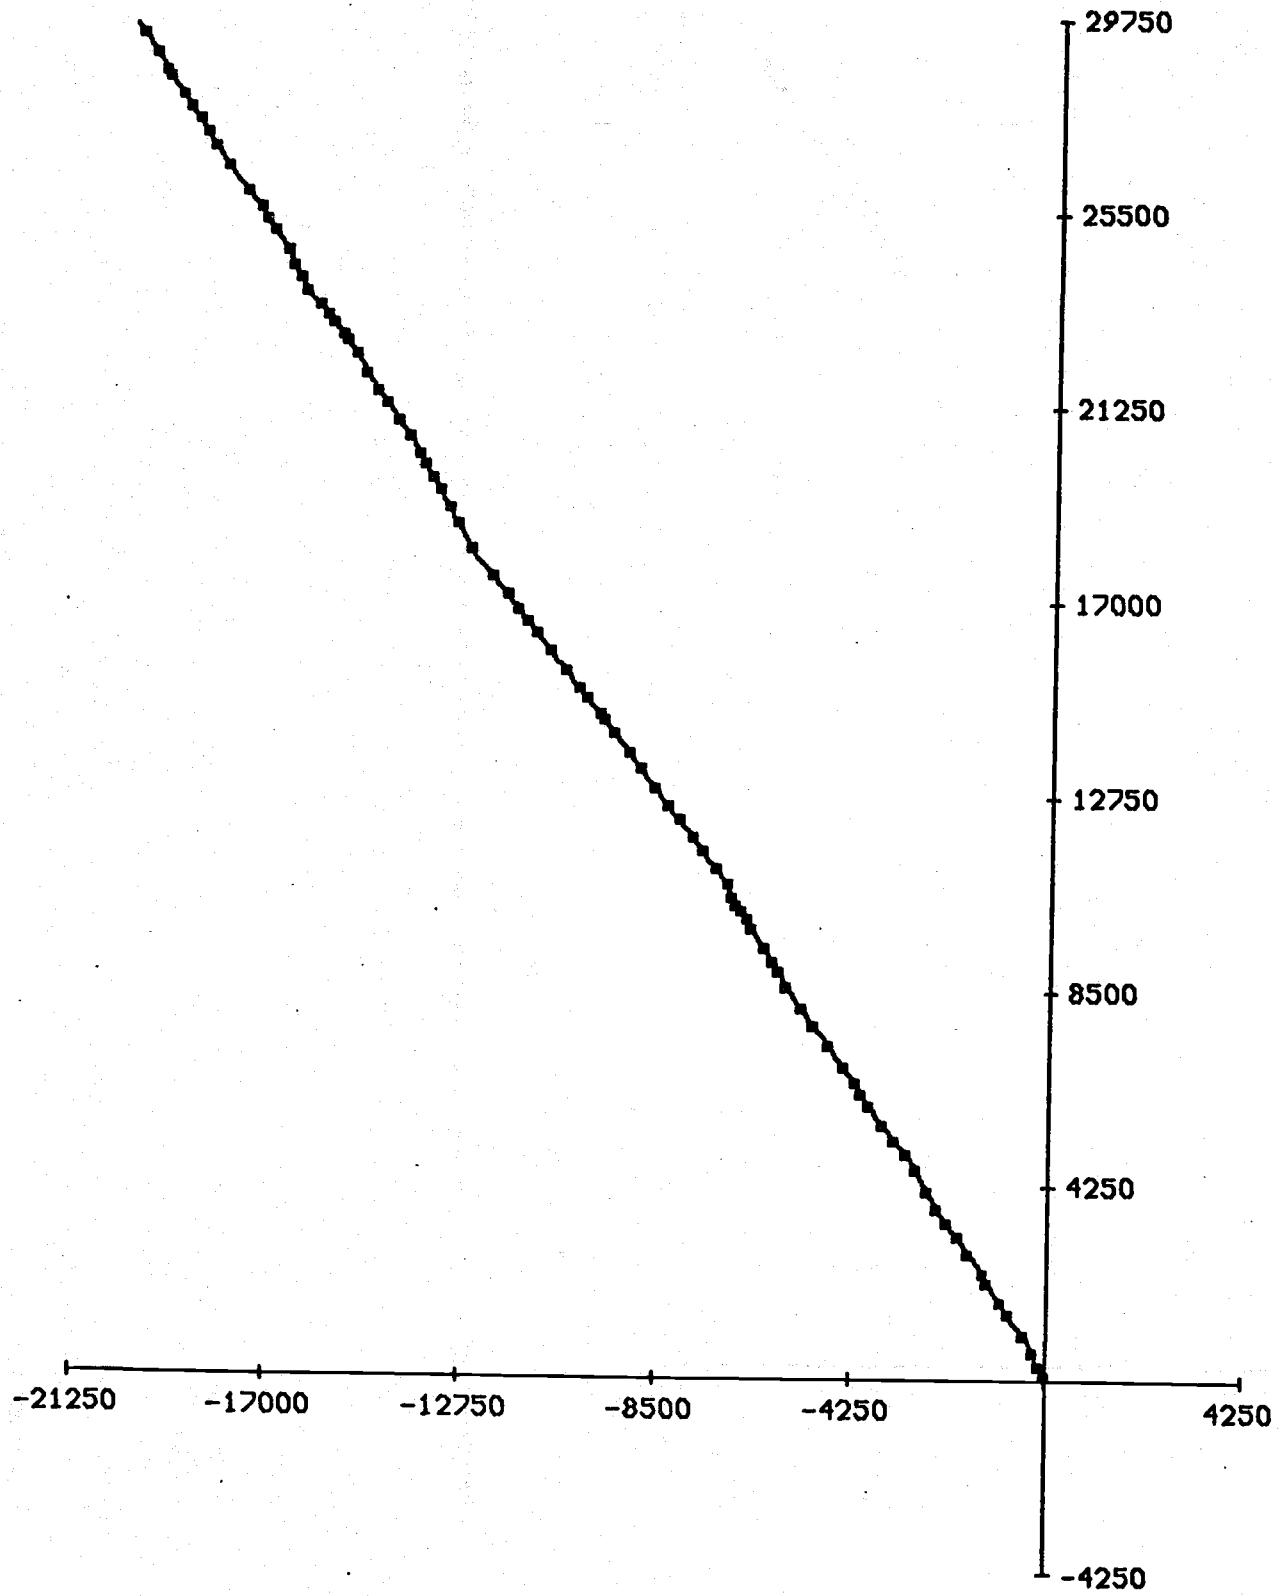

Measured Variables: Speed, direction, air temperature.

Installation Periods:

<u>Leg</u>	<u>Serial Tape #</u>	<u>Installation Time (GMT)</u>	<u>Recovery Time (GMT)</u>	<u>Record Length</u>
II	D127/7	March 19 1976	1830	August 17 1976 1415 89 d, 7 h
III	D127/8	August 17 1976	1445	October 7 1976 1515 50 d, 11 h
IV	D127/9	October 7 1976	1545	Feb. 27 1977 1400 142 d, 16 h
V	D127/10	March 10 1977	1815	May 19 1977 1900 69 d, 10 h

Comments:

The building used for the installation was that of the Instituto del Mar del Peru (IMARPE), located in La Punta, a borough of Callao. The building is about 80 m long, oriented east-west, and seven stories high, the highest for at least a kilometer in any direction. It is situated on a narrow peninsula or spit about 200-300 meters across that extends to the west, with a beach and open ocean to the south (windward) and Callao harbor to the north (leeward). Only flat, open space lies to windward between IMARPE and the south beach. Slightly to the east of windward and across the street, lies a series of two-story buildings. Any distortions of the wind field are probably limited to those produced by the IMARPE building itself.

**APPENDIX I****JOINT II Navigation Charts  
and Positions**

## JOINT II Navigation Charts and Positions

The lack of a single chart with a coastline and bathymetry in which we could be confident plagued us throughout the JOINT II experiment. Although we operated from Chimbote ( $9^{\circ}$ S) to south of San Juan ( $16^{\circ}$ S), most of the work was concentrated between Cabo Nazca and Punta Ana, near  $15^{\circ}$ S; unfortunately, this is a strong candidate for being the worst charted part of the coast.

The charts of the Pisco-San Juan area that we found and used all had soundings based on an 1836 British survey, with some later additions. A German chart (DHI-721) was used to obtain positions for Leg 1 moorings from radar fixes aboard the R/V ALPHA HELIX, in March 1976. The coastline on DHI-721 seems to correspond fairly closely to that on the U.S. chart (H.O. 1218), which cautions: "The coastline for about 10 miles to the southeastward of Pta. del Infiernillo is reported to lie about  $1\frac{1}{4}$  miles southwestward of its charted position". For the rest of the experiment our navigators mainly referenced their radar fixes to the Peruvian chart (DHNM 2200), though occasionally satellite fixes were accepted. While the soundings on DHNM 2200 and H.O. 1218 are apparently based on the same source (i.e. the 1836 survey), the coastline was based on a topographic chart of the Military Geographical Institute of Peru (IGM).\* This coastline does not agree well with that of the German and US charts.

Positions of prominent coastal navigation points from Infiernillo ( $14^{\circ}40'$ S) to Pta. Lomas ( $15^{\circ}33'$ S) are shown in Table A1.1, as they were determined from each of the three charts. The same features on the German and U.S. charts lie within  $\frac{1}{2}$  n.m. or less of each other; this suggests that their coastlines are based on the same source (as were the soundings). Features on the Peruvian chart lie  $1-1\frac{1}{2}$  n.m. from those of DHI-721 and H.O. 1218, in some instances to landward (Cabo Nazca, Pta. Santa Ana) and in others to seaward (Pta. San Juan, Pta. Lomas). Near Infiernillo the coastline on the Peruvian chart lies north and west of the one on the U.S. and German charts, as opposed to the reports that the true coastline lies to the southwest (seaward). This seems to confirm that the DHNM 2200 coastline was based on a different survey. The lack of agreement between surveys is not surprising, considering the rugged, uninhabited nature of the area.

Before we were aware of the discrepancy between charts, we assumed that mooring positions were known to within no less than a nautical mile in order to avoid inconsistencies. Now we feel it sensible to state positions to the nearest  $1/10$  mile relative to the charts used to determine them. Correcting for chart discrepancies usually makes the positions mutually consistent with each other within the limits of typical coastal navigation uncertainties ( $\pm 0.2$  n. miles).

---

\* The IGM Topographic charts we used for land work were based on aerial photographs and geodetic control done by IGM in collaboration with the Inter-American Geodetic Survey in 1966.

Table A1.1 Positions of coastal features as determined from three navigation charts used in the JOINT II Experiment.

Coastal Feature	D.H.I. 721	H.O. 1218	DHNM 2200
Infiernillo	14°40.4'S/75°55.0'W	14°39.8'S/75°55.0'W	14°38.2'S/75°55.8'W
Cerro Doña Maria	14°41.2'S/75°50.2'W	14°40.8'S/75°49.8'W	14°39.5'S/75°50.8'W
Pta. Olleros	14°46.7'S/75°43.1'W	14°46.0'S/75°43.1'W	14°46.7'S/75°44.0'W
C. Nazca	14°57.0'S/75°31.5'W	14°56.8'S/75°31.1'W	14°57.3'S/75°29.8'W
Pta. Sta. Ana	15°08.0'S/75°23.0'W	15°07.9'S/75°22.6'W	15°08.7'S/75°21.9'W
Pta. San Juan	15°21.0'S/75°11.0'W	15°21.2'S/75°10.8'W	15°21.7'S/75°11.3'W
Pta. Lomas	15°32.8'S/74°51.7'W	15°33.4'S/74°50.5'W	15°34.0'S/74°51.0'W

A related problem concerns the bathymetric chart of the JOINT II area produced by O'Brien and Preller, based on the R/V MELVILLE survey of May 1977 (Preller, CUEA Newsletter: 6[4]). Some investigators may have noted (as we have) that stations plotted on this chart are shown to be shallower in depth than was indicated by the ship's PDR when the station was taken (or by pressure sensors, in the case of Aanderaa current meter moorings).

Figure A1.1 (redrawn from O'Brien and Preller) shows how this inconsistency may be related to the coastline discrepancy. The positions of Cabo Nazca and Pta. Santa Ana as determined from DHI-721 and H.O. 1218 (not shown) plotted very close to the corresponding points on the O'Brien-Preller chart. The DHNM 2200 points plot considerably east of, and somewhat south of the points on the other three charts (see triangles, Figure A1.1). The Leg V (1977) current meter mooring positions, based on DHNM 2200, appear too shallow relative to the isobaths (squares). If they are re-plotted using the same range-crossings, but relative to the O'Brien-Preller navigation points, the depths become more reasonable (small circles). Leg I mooring positions (crosses) do not appear to be in serious conflict with the O'Brien-Preller chart, consistent with the fact that those positions are based on radar fixes on the DHI-721 chart. In particular, the AGAVE depth and offshore distance appear much more reasonable than on DHNM 2200, where it shows up as being in 60-70 m of water, and 2.3 n.m. from shore; AGAVE was in fact set about 3/4 n.m. from shore at a bottom depth of 40 m.

Which chart is more correct in an absolute sense is not certain. The processed satellite positions from Scripps appear to lie consistently seaward of the corresponding radar positions on DHNM 2200 (O'Brien, personal communication). The positions given in Table A1.1 and in the installation summaries are the original coordinates determined from the noted navigation charts, and uncorrected for discrepancies between charts. Users are hereby advised of these discrepancies, and if they wish to make corrections, we recommend the above procedure.

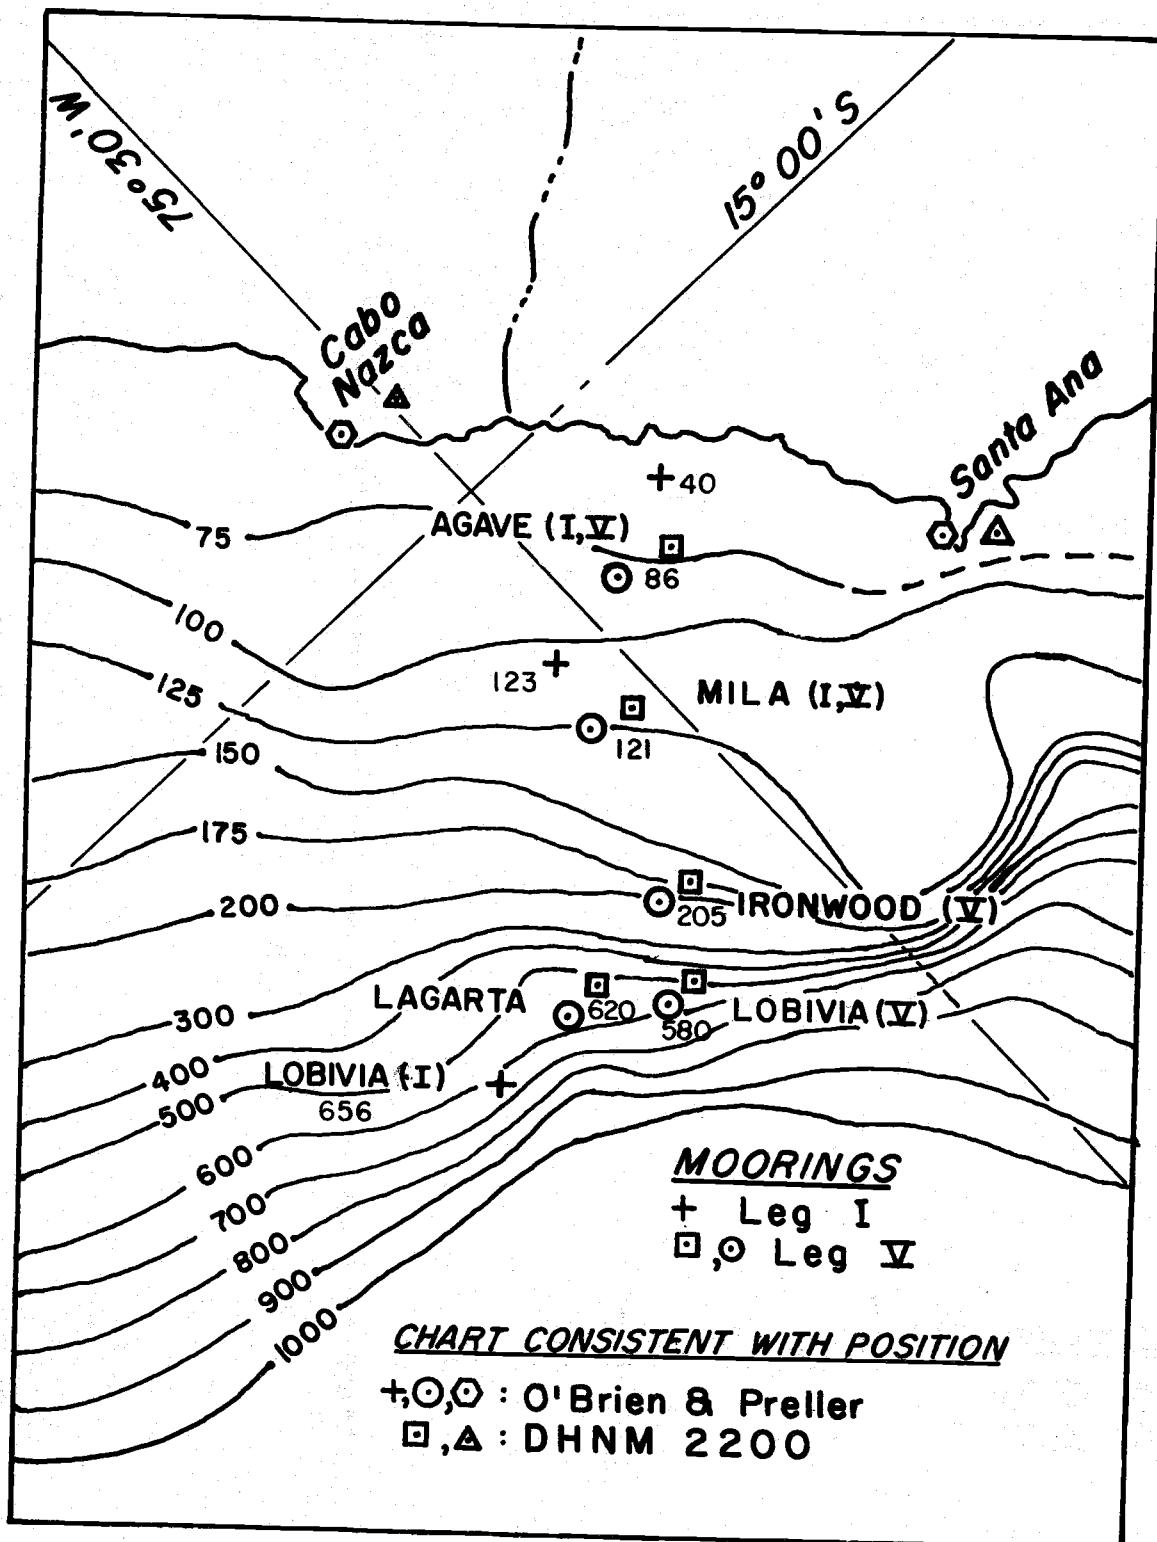

Figure A1.1

Bathymetry and coastline from the O'Brien-Preller chart. Leg I navigation points (○) and moorings (+) were referenced to the DHI 721 chart; Leg V navigation points (△) and moorings (◻) were referenced to the DHNM 2200 charts. Leg V moorings were then "moved" (○) to account for the discrepancy between navigation points (i.e. coastline) on the two charts.

## APPENDIX 2

**Calibration of the Aanderaa Temperature  
Sensors Used in JOINT II**

### Calibration of the Aanderaa Temperature Sensors used in JOINT II

The temperature sensors of the Aanderaa current meters are calibrated at OSU by immersing several current meters in a bath whose temperature is measured by a quartz probe. The quartz probe is itself calibrated at least once per year. Details of the calibration procedure have been described by Barstow (1978).

All but one of the current meter and buoy temperature sensors used in JOINT II were calibrated in this manner at least once. Most of the current meters were calibrated both before and after their use in JOINT II. Some of the current meters were new when the experiment began, and there was no time to calibrate them before the experiment. Others were lost at sea, either during the experiment, or very soon afterwards, and no post-JOINT II calibration could be made.

### Temperature Data from Current Meters

The resolution of the temperature sensors of the Aanderaa current meters is about  $0.02^{\circ}\text{C}$ . For each current meter, we compared the post-JOINT II calibration with the pre-JOINT II calibration, over the actual temperature range observed by that current meter during JOINT II. Current meters for which the pre- and post-calibrations were essentially identical (within  $\pm 2$  bits, or  $\pm 0.04^{\circ}\text{C}$ ) are listed in Table A2.1 (first column). For some current meters, the post-calibration did not agree with the pre-calibration; this generally occurred only when there was a long time (two or three years) between the two calibrations. For these current meters (second column) we used the post-JOINT II calibration curves to process the data. All but one of the current meters which had not been calibrated prior to JOINT II were calibrated afterwards. The post-calibration information was used to process the temperature data from these instruments (third column).

For all but one of the current meters lost before post-calibration was possible (Table A2.2), we used the pre-calibration to process the data. Our long-term calibration records indicate that the calibration of each instrument generally changes by less than  $0.1^{\circ}\text{C}$ , but one change of  $0.2^{\circ}\text{C}$  has been observed. We estimate the accuracy of this group to be well within  $0.2^{\circ}\text{C}$ .

The one remaining current meter (Parodia, 24 m) had no recent calibration, and was lost with Peyote II, a mooring that had been left on the Peru shelf off Huarmey in May 1977, for recovery in November 1977. No trace of this mooring was found during the recovery attempt. The data from 24 m, Parodia was processed using an average calibration curve for OSU current meters.

Table A2.1

Locations and depths of current meters for which (a) pre-JOINT II and post-JOINT II temperature calibrations changed by 0.04°C or less; (b) pre-JOINT II and post-JOINT II temperature calibrations did not agree (post-calibration curves were used to process the data); (c) no pre-JOINT II calibrations exist. The precision of the Aanderaa water temperature channels is believed to be  $\pm 0.04^\circ\text{C}$ .

Installation Phase	Station Name	(a)	(b)	(c)
		Pre- and post-calibrations agreed	Pre- and post-calibrations disagreed; Post-calibrations used	Not pre-calibrated; Post-calibrations used
Leg I:	Agave	29 m	10 m	
	Sour	80 m	100 m	
	Mila	28,53 m	78 m	
	Islaya		41,66,116 m	
	Lobivia	206,556 m	406,626 m	
Leg II:	Mila	62 m	33,84,109 m	
	Lagarta	115,212 m	312,412 m	
	Yuca	80,100 m		
Leg III:	Mila	79,104 m	28,53 m	
Leg IV:	Mila	23,48,73 m		
Leg V:	Agave	26,67,77 m	46 m	
	Mila	39,59,80,100 m	19 m	115 m
	Ironwood	24,44,63,105,155,180 m		
	Lagarta	92,115,214 m		512 m
	Lobivia	58,83 m		183,283 m
	Euphorbia	63 m	26 m	
	Opuntia	129,324 m		224,524 m
	Yucca-Too	37 m	57 m	97 m
	Peyote	56 m		37,96 m

**Table A2.2** Locations and depths of current meters for which there is no post-JOINT II calibration data, with the serial/tape number and the date of last calibration. For the current meters calibrated in 1976, the accuracy of the temperature data is believed to be  $\pm 0.04$ . For the remainder, the accuracy is believed to be within  $\pm 0.2^{\circ}\text{C}$ .

Leg I	Lobivia	106 m	(684/28)	27 Nov. 73
Leg IV	Mila	99 m	(503/34)	4 Feb. 76
Leg V	Parodia	24 m	(438/24)	no recent calibration
	Parodia	64 m	(452/37)	14 Sept. 73
	Parodia	104 m	(485/35)	4 Feb. 76

Water Temperature Data from Meteorological Buoys

A similar study was made of the water temperature sensors on the meteorological buoys. The sensors are made by Aanderaa, and the data is recorded by Aanderaa data loggers. The resolution of the data is  $\pm 0.08^\circ\text{C}$ . The temperature data from the buoy temperature sensors is, therefore, of lesser quality than the data from current meters. If the pre- and post-calibrations agreed to within  $\pm 2$  bits ( $\pm 0.16^\circ\text{C}$ ), we deemed them to be identical.

Some of these temperature sensors exhibited a drift, which was apparently caused by a very small leak. All of the data was therefore compared with 3 m temperature data from CTD casts whenever possible. The results are summarized in Table A2.3.

Table A2.3 Summary of 3 m water temperature data from meteorological buoys.

Mooring	Post- and Pre-Calib. Agree	Agrees with CTD Data	Data Accepted as Good
Mila IB	no post-calib.	yes	yes
Mila II	no	no	no
Mila V	yes	yes*	yes
Ironwood	no	no	no
Lagarta	no	no	no
Euphorbia	yes	yes*	yes
Parodia	yes	yes*	yes

\* Very little CTD data available for comparison.
