

Supplementary figure 2

**Figure S2: Schematic representation of simplified crossing of the *TO(Kras*<sup>G12V</sup>) with the respective *RhoA* transgenic line.** Double transgenics were labelled with both mCherry and EGFP, and can be differentiated from their single transgenic or wild-type siblings with fluorescence microscopy. Simplified diagram for the purpose of illustrating the double transgenic larva from each cross. Scale bar is 500  $\mu$ m.
