ROLE OF RESEARCH PROGRAMS

Research involvement contributes to the strength of Oregon State University's engineering programs by providing the means to involve faculty in the advancement of knowledge, and supplementing salary resources for the employment of faculty and support personnel. Because of research, more than a third of the College's faculty is involved at any one time in investigations which take them beyond their normal classroom teaching responsibilities. Appropriated teaching salaries which would have been paid to those involved in this sponsored research are used to hire additional faculty. The result is a more diverse and highly qualified group of teaching and research engineers in the various engineering disciplines, and higher quality educational programs at both the undergraduate and graduate levels. Instructional laboratories for students benefit from the research program as equipment initially acquired for research is subsequently used for teaching. Oregon State University has long been known as a quality teaching institution. Continuing research involvement by a strong nucleus of active research engineers is vital to maintenance and enhancement of this reputation.

RESEARCH FUNDING TRENDS

Engineering research at Oregon State University is supported entirely by grants and contracts. No State of Oregon funds are budgeted for research operations. The graph shown below summarizes research funding trends over the years since 1970 and shows that new grants and contracts this past year are down from last year when they reached an all time high, but stable when compared to funding levels over the last several years. The Federal Government is the leading source of research support.

In addition to funds for specific research grants, the graduate programs of the College of Engineering received supplemental funding of \$385,830 this past year in the form of fellowships and equipment grants.

RESEARCH INVOLVEMENT AND PRODUCTIVITY

Table 1 shows the numbers of professorial faculty in the College's departments, degrees granted and new research grant funding for 1982-1983. Table 2 provides the distribution of actual research expenditures for the same period. Of the College's professorial faculty 47 were at least partially supported by research projects in 1982-83. Sixteen other faculty and research personnel worked on the projects, along with 79 graduate research assistants. Twenty-seven undergraduate students held part-time research-related jobs.
