 SUMMARY OF GAME INVENTORIES	188

**OREGON GAME COMMISSION
ADMINISTRATIVE
REGIONS**

INTRODUCTION

This report summarizes findings relating to Oregon's wildlife resources. Specific information for the period from July 1, 1966 through June 30, 1967 is presented, along with comparative data from previous years. A summary of service and development programs is included.

Since the report is designed primarily as a reference for use by those interested in game management, most of the data is presented in tabular form. Descriptive material and interpretations are limited.

Oregon supports a diversity of game with one or more forms present on nearly every portion of the state's 96,000 square miles of habitat. Big game species include three forms of deer, two forms of elk, pronghorn antelope, black bear, bighorn sheep, and mountain goat. Twelve species of resident upland game are present while migratory mourning doves, band-tailed pigeons, and a variety of ducks and geese are found seasonally throughout much of the state.

Hunting in Oregon is of interest to a great many people as indicated by the fact that 343,360 individuals purchased licenses in 1966. Big game hunters bagged 163,700 animals and enjoyed 1,997,000 days afield in the process. The harvest of birds totaled 1,362,000 for all species, and recreation from bird hunting amounted to 998,400 man-days.

A growing diversity of interests, more competitive demands for the use of land and water, and increasing population pressures continue to complicate the task of maintaining wildlife resources and recreational opportunities. Since most game management is practiced on land administered by others, cooperative programs are essential. Much progress has been made, particularly on public lands where administrative agencies have undertaken extensive wildlife habitat improvement projects. The need for expanding such cooperative programs is paramount.

The management program of the Game Division is planned and coordinated by a division chief assisted by four staff specialists. Twenty district biologists stationed in five administrative regions, and other specialized persons execute the program. Other agencies and groups share the management responsibility, including the Research Division of the Department which is charged with basic research, the Department of State Police which is responsible for game law enforcement, and the Fish and Wildlife Service, U. S. Department of the Interior, which has primary responsibility for migratory birds and also administers the cooperative predator and rodent control program.

BIG GAME

B I G G A M E R E S O U R C E S

Oregon's big game resources provided approximately two million man-days of outdoor recreation and 18,000,000 pounds of game meat in 1966.

The number of licensed hunters totaled 343,360, an increase of 5 percent. Deer tag sales totaled 285,961, an increase of 3 percent. Elk hunters increased 4 percent, with a total of 69,880 tags issued.

The reported 1966 harvest included 148,000 deer, 11,400 elk, 445 antelope, 3,900 bear, 5 mountain goats, and 3 bighorn sheep.

Poor moisture supplies for the 1966 growing season resulted in an inadequate supply of food on eastern Oregon big game ranges. This condition made the animals more active and contributed to the high success of hunters in the fall of 1966.

The winter of 1966-67 was unusually mild. Fall rains provided a supply a green forage for the winter months and winter survival was high on most ranges.

1967 spring inventories indicated significant increases in mule deer and antelope but little change in the density of black-tailed deer or elk.

New programs initiated for big game during the year were a Roosevelt elk trapping and transplanting program, a mule deer feeding study, the utilization of computers for analyses of harvest data, an evaluation of deer hunting by area and time interval, and expansion of the winter range rehabilitation program.

The 1967 legislature assigned additional functions such as protection of cougar in specified areas.

BLACK-TAILED DEER

Winter sampling of black-tailed deer on 2,793 miles of census routes produced a count of 12,984 deer for an average of 4.6 per mile compared with 5.2 deer per mile in 1966. Most black-tailed deer units illustrated similar or slightly increased populations over 1966. Exceptions were the Hood River and Wasco Units, where blacktail populations have declined 30 to 50 percent. Blacktail census methods include foot and spotlight samples (Table 1). The use given census data indicates a need to standardize the method for western Oregon.

Classification of 5,498 deer indicated a herd composition ratio of 33 bucks and 72 fawns per 100 females, or 16 percent bucks, 49 percent does, and 35 percent fawns (Table 2). The 1965 ratios were 42 bucks and 66 fawns per 100 females, or 20 percent bucks, 48 percent does, and 32 percent fawns. This probably reflects the improved hunting success enjoyed during the 1966 season.

Deer winter loss was very mild in western Oregon, totaling 12 carcasses in 443 miles of travel. Losses observed in an overstocked population of deer in the Cedar Creek pen study gave cause to closely examine other winter ranges in western Oregon, but intensive search by biologists failed to show any appreciable loss of deer in western Oregon (Table 3).

Hunters reported taking 59,459 black-tailed deer of which 25 percent, or 14,700, were antlerless. Hunter success averaged 52 percent for the 114,000 black-tailed deer hunters compared with 44 percent in 1965 (Table 22). The black-tailed deer harvest contributed 40 percent of the total Oregon deer harvest. Table 25 shows a 15-year summary of deer harvest.

Early and extended deer seasons comprised 18 percent of the total blacktail kill, while controlled seasons provided only 4 percent of the total blacktail harvest.

General, early, extended, and controlled seasons are presented by unit in Table 22. Early and extended seasons are shown by area in Table 23, and controlled seasons are shown in Table 24.

Black-tailed deer damage complaints declined slightly from 1965. Chemical repellents and kill permits were utilized to relieve damage for the majority of complaints (Table 19). Fencing contracts were initiated and completed with 70 landowners for 6,422 rods of fencing at a cost to the Commission of \$17,299.00 (Table 20).

Anything less than 0.1 deer per mile is indicated by (-).

MULE DEER

Spring inventory of mule deer on winter ranges produced a total of 50,442 deer observed along 3,667 miles of census routes. The trend index of 13.8 deer per mile represented a 10 percent increase over the 1966 index of 12.4 deer per mile. Increases in deer populations were reported from all of the three regions comprising eastern Oregon mule deer habitat. (Table 4.)

Classification of 23,739 mule deer indicated a herd composition of 17 bucks and 76 fawns per 100 females, or 9 percent bucks, 52 percent females, and 39 percent fawns. The 1965 averages were 20 bucks and 63 fawns per 100 does, or 11 percent bucks, 54 percent does, and 35 percent fawns. Fawn production improved 17 percent compared with 1965 and compared favorably with the 1964 average of 80 fawns per 100 females. The Southeast Region showed improved fawn production except for the Steens Mountain Unit, which averaged only 42 fawns per 100 females compared with 47 in 1965. Central Region averages show marked improvement in all units except Wasco County. The average for the Northeast Region remained the same, although individual units varied throughout the area. (Table 5.)

Mule deer antler class percentages are given in Table 6. Spike and two-point bucks comprised 46 percent of the total bucks classified compared with 48 percent in 1965.

Winter loss was practically non-existent on eastern Oregon ranges as noted in Table 7.

Bitterbrush utilization measurements indicate an average of 67 percent use in 1966 (Table 16). Leader growth was poor due to drought conditions last spring, and many desert ranges experienced heavy summer use before wintering deer use occurred. The mild winter experienced in 1966 precluded an expected heavy loss of animals from lack of adequate forage. Moisture conditions have been very good in eastern Oregon during early 1967 and browse production is expected to be good.

Range vegetative trends, presented in Table 17, show decreased in desirable vegetation and a decline in plant density on all of the four units sampled. The Lookout Mountain Unit shows a slight improvement in vegetation and litter compared with 10 years ago. This range is primarily a grass-sagebrush range, but soil conditions and topography lend themselves well to rehabilitation in the form of browse plantings.

Mule deer damage complaints totaled 193 in 1966 compared with 110 in 1965 and 196 in 1964. A summary of complaints and action taken is presented in Table 19.

Hunters reported taking 88,516 mule deer, which was the fourth highest kill on record. The 156,720 mule deer hunters averaged 56 percent success compared with 50 percent in 1965 (Table 22). The mule deer harvest made up 60 percent of the total deer harvest. (Table 25.)

The antlerless mule deer harvest consisted of 22,821 animals and contributed 26 percent to the total deer kill. Early and extended seasons comprised only one percent of the total kill, while controlled seasons contributed 4 percent to the total kill.

Tables 22, 23, and 24 present hunter harvest information for the general, controlled, and early and extended seasons.

A supplemental deer winter feeding study was initiated in the Keating Unit during the 1966-67 winter period. A high energy ration was designed and offered to deer in pellet and block form. The study was discontinued the middle of February 1967 because the winter was too mild to place stress on the animals and move them to low concentration areas. It was determined that deer would accept the non-inhibited pelleted ration without any detrimental effect. It also appears that the 9 percent salt inhibitor ration pellet may be too strong with salt. A more severe winter must be experienced in order to properly assess the value of the ration.

INTERSTATE DEER HERD

Animal inventories for the Interstate deer herd, which summers in Oregon and winters in California, are conducted jointly by the California and Oregon Game Departments, the Modoc and Fremont National Forests, and the Bureau of Land Management.

Information pertaining to this herd is included in the following table.

BASIC DATA OF THE DEVIL'S GARDEN-INTERSTATE DEER HERD

YEAR	TRACK COUNT	DEER HARVEST			HERD COMP.			BITTERBRUSH UTILIZATION

Anything less than 0.1 deer per mile is indicated by (-).

ROOSEVELT ELK

Western Oregon census samples, totaling 357 miles, indicated an average of 5.6 elk observed per mile of sample. This average indicates a very slight increase in elk observed during the past three years but is still below the 1964 average of 6.2 elk per mile.. The 9.3 elk per mile average in northwestern Oregon is the highest number of elk per mile on record. (Table 8.)

Classification of 3,957 animals during 1966-67 averaged 4 bulls and 47 calves per 100 cows, or 2 percent bulls, 66 percent females, and 32 percent calves. Hunting pressure has reduced the number of bulls remaining after hunting season to a very low level. The 47 calves per 100 cows illustrates satisfactory production, indicating that breeding is still being accomplished regardless of the low carry-over of bulls. (Table 9.)

Winter loss of elk was very light last year in all areas due to the mild, open, snow-free winter experienced throughout western Oregon.

Elk damage complaints in western Oregon totaled 35 compared with 37 in 1965. Winter archery seasons have helped relieve complaints in both the north coastal and Coos County areas.

An elk capturing project was initiated on the Milllicoma Tree Farm for the purpose of transplanting elk to areas of suitable habitat not presently inhabited by this animal. The animals were drugged by the use of a Cap-Chur gun, removed to a holding pen by means of a sling and winch, and later released when a number sufficient for hauling was obtained. Twenty-one animals including 15 cows, 3 bull calves, 2 female calves, and 1 spike bull were released in the area between Galice and the Illinois River. Eight animals including 6 cows, 1 female calf, and 1 spike bull were released on the South Fork of Elk River in Curry County. Nine elk were released inside the Milllicoma research study enclosure, making a total of 38 animals captured and moved to other locations.

The tranquilizer gun has also been utilized to immobilize and tag almost 450 elk in the Milllicoma Tree Farm study. A 460-acre enclosure was constructed on the area this year and will be utilized to study the effects of controlled elk densities on Douglas fir regeneration and biological studies of elk.

Elk hunters were again required to choose between hunting Roosevelt or Rocky Mountain elk by issuance of separate tags. Roosevelt elk hunters were further restricted by a delayed opening and shortened season of only sixteen days. Since 1964, this regulation has reduced the pressure on Roosevelt elk by an eight percent reduction in total Roosevelt elk hunters; however, the north

coastal area has experienced a 19 percent reduction in the same period.

The 1966 harvest included 2,500 bulls and 183 antlerless elk and contributed 23 percent of the total elk kill. A total of 18,674 persons reported hunting Roosevelt elk for a success ratio of 14 percent. Table 26 presents harvest by unit and region while Table 27 summarizes elk hunting trends since 1933.

General season information, gathered at the Millicoma Tree Farm gates in Coos County, is presented in the following table.

ROCKY MOUNTAIN ELK

Rocky Mountain elk census trends were changed to aerial census only instead of the combination ground-aerial routes used in past years. District biologists counted 15,339 elk on 2,054 miles of flight, averaging 7.5 elk per mile compared with 7.1 elk per mile in 1966. This is almost identical to the number observed in the spring of 1964. Information obtained by ground census methods is shown in Table 11.

Classification of 4,891 elk indicated a herd composition of 6 bulls and 53 calves per 100 cows compared with 9 bulls and 49 calves per 100 cows in 1966. These figures indicate 4 percent of the herd were bulls, 63 percent cows, and 33 percent were calves. (Table 12.) The steadily increasing hunting pressure on Rocky Mountain elk has been directly reflected in the continuing decline in the number of bulls remaining after the hunting season.

Field personnel received 30 elk damage complaints in 1966 compared with 28 in 1965. Table 19 includes a summary of damage complaints and action taken.

The Wenaha Game Management Area elk tagging study was completed and tag returns indicate approximately 60 percent of the elk wintering on Bartlett Bench summer in Washington, while 15 percent of the Eden wintering herd summer in Washington. Ninety-eight percent of the tag recoveries ranged less than 25 miles from the trap site. Hunters harvested 66 percent of the total male elk tagged and 19 percent of the total female animals tagged.

Rocky Mountain elk hunters reported taking 8,718 elk, including 5,529 bulls and 3,189 antlerless compared with 9,362 in 1965. Hunter success averaged 18 percent compared with 20 percent in 1965. The number of elk hunters increased by approximately 2,000 over 1965. (Tables 26 and 27.)

ANTELOPE

Aerial census covering 4,125 flight miles counted 7,593 antelope for an average of 1.8 antelope per mile of travel, indicating a slight increase in population trends. (Table 13.)

Classification of 1,763 antelope during August, just prior to the hunting season, indicated a herd composition of 31 bucks and 40 fawns per 100 does, or 17 percent bucks, 58 percent does, and 25 percent fawns. Tables 14 and 15 present herd composition by counties and a comparison since 1950.

Antelope populations have not shown an increase from the protection given the herds through regulations. A definite need for an extensive study to determine the cause for lack of production is needed.

Hunters reported taking 445 buck antelope on 775 tags issued, for a hunter success of 64 percent. Table 33 presents a summary of the 1966 season. Table 34 includes a 17-year comparison of antelope seasons.

ROCKY MOUNTAIN GOAT

Aerial census in the Wallowa Mountains during the summer of 1966 revealed a total of 32 goats observed compared with 39 seen in 1964.

Five hunters were successful in bagging 3 males and 2 females during 1966. This was the second goat season in Oregon, following the initial season of 1965 in which 4 males and 1 female goat were harvested.

BIGHORN SHEEP

Three sheep tags were issued for a season beginning September 24 and extending through September 30 in portions of Hart Mountain. All three tag holders were able to bag a full 3 1/4-curl ram. This was the second sheep season held in Oregon during the past 40 years.

RANGE CONDITIONS

The cold, late spring in 1966 together with an extremely dry summer produced poor bitterbrush growth averaging only 3.7 inches. Utilization measurements showed that approximately 21 percent of the available plants had been consumed by November and that an additional 46 percent were eaten during the winter. The total use by all animals averaged 67 percent of the total production on winter ranges. Utilization would probably have been extreme this past year if the winter had not been an open, mild period, allowing some plant growth throughout the winter.

Table 16 includes a five-year comparison of growth and utilization.

The Parker condition and trend transects read this past year, as shown in Table 17, indicate a decline of desirable vegetation and plant density.

The reading schedule for Parker transects is given in Table 18.

BIG GAME DAMAGE

Big game damage complaints, listed in Table 19, show a total of 1,339 deer and 65 elk complaints processed in 1966. This is similar to the number handled in 1965 when 1,368 deer and 65 elk complaints were received.

The issuance of repellents was the primary method used for damage control, followed by permits to kill offending animals. In eastern Oregon, supplying panels for the protection of haystacks was the major method used.

Cooperative fencing agreements with landowners resulted in construction of 79 deer-proof fences which cost the Commission a total of \$24,310. This is twice the amount expended in 1965 when 5,065 rods of fence were built, costing the Commission \$12,579.63. A summary of fence contracts by unit and region is given in Table 20. A total of \$259,287 has been spent on 939 fencing contracts since the program was initiated in 1949, or an average of \$14,404 per year.

Haystacks in eastern Oregon are protected against big game use by the loaning of wooden panels. During 1966, 2,029 panels were supplied for the protection of 121 haystacks. Approximately 45,000 panels have been issued to protect 3,250 haystacks in eastern Oregon.

A summary of previous years' emergency hunts is included in Table 21.

HUNTING SEASONS

The 1966 big game seasons provided 1,960,000 man-days of recreation and a harvest of more than 160,000 big game animals. The reported deer harvest of 147,975 deer by 270,769 deer hunters ranks third toward the highest kill on record. The reported elk harvest of 11,402 elk by 68,168 hunters ranks fifth toward the highest elk kill and was the largest number of hunters recorded.

General season dates for mule deer were October 1 through October 23. Black-tailed deer season was extended to October 30 to provide additional opportunities to harvest this species. Antlerless deer unit permits became valid October 15 and extended through the rest of the general season. A total of 106,850 antlerless deer unit permits was issued compared with 99,650 in 1965, 95,700 in 1964, and 135,000 in 1962. Thirteen controlled deer seasons with 8,750 tags resulted in a harvest of 5,547 deer. (Table 24.) Nine early or extended deer seasons resulted in the harvest of 11,419 deer. (Table 23.) Table 22 shows the results of all deer seasons held in 1966, while Table 25 summarizes all deer seasons since 1952.

Requests from several Oregon fire protective agencies for a two-week later opening of the general deer season prompted an investigation of hunter habits and preferences. A deer hunting survey questionnaire, a separate survey from the "annual hunting questionnaire," was mailed to 4,066 persons reporting deer hunting in 1965. Returns were received from 2,704 persons who had received the questionnaire.

Big game harvests were computed through analyses of a random survey questionnaire mailed to 17,369 Oregon hunters.

Fifteen percent of the persons hunting in 1965 did not hunt deer in 1966. This previously undefined turnover in the hunter population, together with a 3 percent annual increase of deer hunters, suggests at least 18 percent are beginning or intermittent deer hunters.

Figure I provides the region of residence of Oregon deer hunters, illustrating that 76 percent live in western Oregon. Figure II illustrates the distribution of deer hunting activity by regions. Figure III and Table 26 show hunting pressure and deer kill by time and type of hunting season. Table 27 includes a summary of habits of hunters by region.

The general elk season opened October 29 and extended through November 27 for eastern Oregon hunters. The western Oregon season opened November 12 and extended through November 27. The antlerless unit permit became valid November 12 through November 27 in

eastern Oregon. Five special elk seasons were authorized in 1966. Table 28 summarizes the 1966 general and permit elk seasons. Table 29 includes a sample of elk seasons since 1933.

The issuance of separate elk tags and a shortened Roosevelt elk season resulted in an 8 percent decline in western Oregon hunters. The total increase in elk hunters was noticeable in the south-eastern Oregon either-sex area.

Elk hunter success continues to decline in the face of an ever increasing elk hunter population.

The hunter questionnaire indicated that 10,693 persons hunted as archers and killed 880 deer and 111 elk.

Return cards from 686 of the 775 antelope tag holders reported a harvest of 445 bucks. Area V, of the six antelope areas open to hunting, reported the highest hunter success with 73 percent of the tag holders bagging a buck. The 1966 antelope season summary is shown in Table 30. Table 31 includes a 17-year summary of antelope seasons.

Three California bighorn sheep tag holders limited with full 3/4-curl rams. The season opened September 24 and extended through September 30.

Five mountain goat hunters bagged 3 male and 2 female goats during the Wallowa Mountain season which opened September 24 and extended through September 30.

Each hunting season has illustrated an increasing demand by more hunters for Oregon's big game resources. The 1966 season experienced a 2.8 percent increase in deer hunters and a 3.6 percent increase in elk hunters.

SMALL GAME

PHEASANTS

The 1967 breeding population revealed an average density of 19.5 pheasants per 100 acres on the 14,025 acres of habitat sampled. This average was 12 percent below 1966. While 9 percent more breeders were found in western Oregon, approximately 15 percent fewer were tallied east of the Cascades. The most substantial declines were recorded in Umatilla, Morrow, and Baker Counties. Ratios of cocks per 100 hens compared with 1966 averages. Breeding population data is summarized in Tables 1 and 2.

Pheasants wintering on the E. E. Wilson Game Management Area declined 10 percent from 1966. The breeding population was the lowest recorded to date, as shown in Table 3.

Crowing counts were made on 53 sample routes. The state-wide index of roosters heard per mile declined 4 percent from 1966. Approximately 10 percent more birds were heard in western Oregon, while the index dropped 21 percent in eastern Oregon. A four-year comparison is shown in Table 4.

Production measurements the first two weeks in August are summarized in Table 5. A total of 3,600 pheasants was counted on 2,621 miles sampled during the survey, representing a 7 percent decrease from 1966. Most of the decrease was due to substantial declines in Lane and Baker Counties. Elsewhere, some increase was evident with 60 percent more birds being counted in Wasco and Sherman Counties, 10 percent more in Malheur County, 4 percent more in Umatilla County, and 17 percent more in Jackson County.

A total of 309 broods was classified and 88 percent of the hens had broods compared with 81 percent in 1966. Individual broods averaged 2 percent more chicks and the average number of chicks per hen increased 11 percent over last year. Increased productivity was fairly uniform in all regions. Approximately 94 percent of all broods observed were at least one month old by August 1 compared with 90 percent in 1966.

Table 6 summarizes Malheur County damage complaints for the past ten years. The number received in 1967 was 30 percent below 1966 and 11 percent below the ten-year average.

VALLEY QUAIL

Quadrat sampling indicated a 22 percent decline in the state-wide breeding population compared with 1966. A 10 percent increase in western Oregon was offset by a 28 percent decline east of the Cascades. The drop was most apparent in Jackson, Wasco, Morrow, Umatilla, and Grant Counties.

A total of 6,059 birds was recorded on 4,066 miles sampled during the production survey, indicating a 25 percent increase over 1966. Approximately 75 percent more quail were counted in western Oregon and 15 percent more in eastern Oregon. The increase was fairly uniform except in Klamath, Deschutes, and Lake Counties. Table 7 presents the production data.

Number of chicks per brood averaged 13 percent above 1966, while the average ratio of chicks per adult compared with the high ratio recorded last year, indicating good production. Hatching was delayed, as only 80 percent of the broods were one month or older by August 1 compared with 85 percent in 1966.

BOBWHITE QUAIL

No bobwhites were observed on the quadrat samples this year.

Thirty-eight birds were tallied in the north end of the Willamette Valley during the production survey, with 10 in Umatilla County and 7 in Malheur County. Three broods were observed, averaging 12 chicks per brood. No broods were seen in 1966.

MOUNTAIN QUAIL

More mountain quail were observed on the big game sample routes, as revealed in Tables 12 and 13. The increase averaged 9 percent state-wide, 175 percent in the Central Region and 47 percent in

the Northwest Region. In the Southwest Region, 22 percent fewer birds were observed.

Production data is summarized in Table 8. Approximately one-third more birds were counted on 2,160 miles sampled compared with 1966. All of the increase was recorded in western Oregon while the eastern Oregon population remained stable. Average numbers of chicks per brood increased slightly while the ratio of chicks per adult increased 18 percent above last year. Half of the broods observed were less than a month old on August 1.

CHUKAR PARTRIDGE

Chukar numbers observed on 1,636 miles of big game routes last winter declined 53 percent from the previous year. Table 9 presents the information and indicates the lowest breeding population recorded in the past four years.

Total numbers observed on 1,733 miles sampled during the production survey declined 15 percent from 1966 as shown in Table 10. A direct comparison cannot be made, however, as nearly half of the 1966 total was recorded in Malheur County where dry conditions concentrated the birds. Comparisons by area indicate one-third more chukars on the Lower Deschutes and Upper John Day drainages, and two-thirds more on the Lower John Day. Numbers along the Snake River in Baker County and in Malheur County declined almost 60 percent from last year, while no change was apparent in Harney County. Individual broods averaged the same number of chicks as in 1966 with substantial increases apparent in Morrow, Grant, and Harney Counties. The ratio of chicks per adult increased one-third, indicating improved production in all areas. Only 80 percent of the broods were at least a month old by August 1 compared with 90 percent last year.

HUNGARIAN PARTRIDGE

Numbers of Hungarian partridge observed on big game samples declined 39 percent from 1966 as shown in Table 9, but one-third more were counted on the upland game quadrats.

Production data is presented in Table 11. Only 301 birds were counted on 1,888 miles sampled due to the widespread distribution of the species. The average density compared with 1966, although some decline was evident in Baker and Morrow Counties. Average numbers of chicks per brood increased 29 percent while the ratio of chicks per adult increased 53 percent, indicating improved production.

FOREST GROUSE

Tables 12 and 13 summarize the numbers of blue and ruffed grouse observed on big game samples. Over twice as many blue grouse were observed in western Oregon compared with last year, but only one-third as many in eastern Oregon. This decline was most pronounced in Wallowa County. Similar numbers of ruffed grouse were counted both years. Substantially more birds were heard on the spring hooting and drumming counts as shown in Table 14.

The production survey indicated one-third more blue grouse than in 1966. Some decline was apparent in Douglas and Union Counties and in the north end of the Cascades, while increases were fairly uniform elsewhere. Individual broods averaged 7 percent more chicks and the ratio of chicks per adult increased 14 percent. Improved production was most apparent in Wallowa County. Table 15 summarizes the production information.

Although few ruffed grouse were observed on the production survey, the limited data in Table 16 indicates an 11 percent reduction in average brood size and a 14 percent decline in the ratio of chicks per adult compared with last year.

All but 6 percent of the broods observed were at least one month old by August 1.

SAGE GROUSE

Sage grouse males counted on 21 strutting grounds last spring declined 10 percent from 1966 and 4 percent from the average for the past eight years. A comparison of counts is presented in Table 17.

Table 18 summarizes the production data. Only one-third as many birds were counted on the 716 miles of sample compared with 1966. Brood size increased 9 percent while the ratio of chicks per adult improved 50 percent. Despite the increase, the ratio of 1.2 chicks per adult remained low and indicates poor production.

TURKEYS

No information is available on turkey population trends. Field observations on the east slopes of Mt. Hood reveal widespread distribution throughout the mixed conifer and hardwood habitat. More broods have been observed this year in the White River Management Area, indicating good production.

Sporadic reports of turkeys continue to be received from the vicinity of release sites elsewhere in eastern Oregon, but no

substantial buildup in numbers is apparent.

Mild weather conditions last winter assured an ample supply of natural foods and no trapping was attempted.

SILVER GRAY SQUIRRELS

Squirrel numbers remained high in Jackson and Josephine Counties, the only areas where information is gathered. Girdling of pine trees and damage to fir cone production were reported, indicating peak populations. The following tables compare squirrel numbers observed throughout the year during routine field work and also the animals counted on big game samples.

MOURNING DOVES

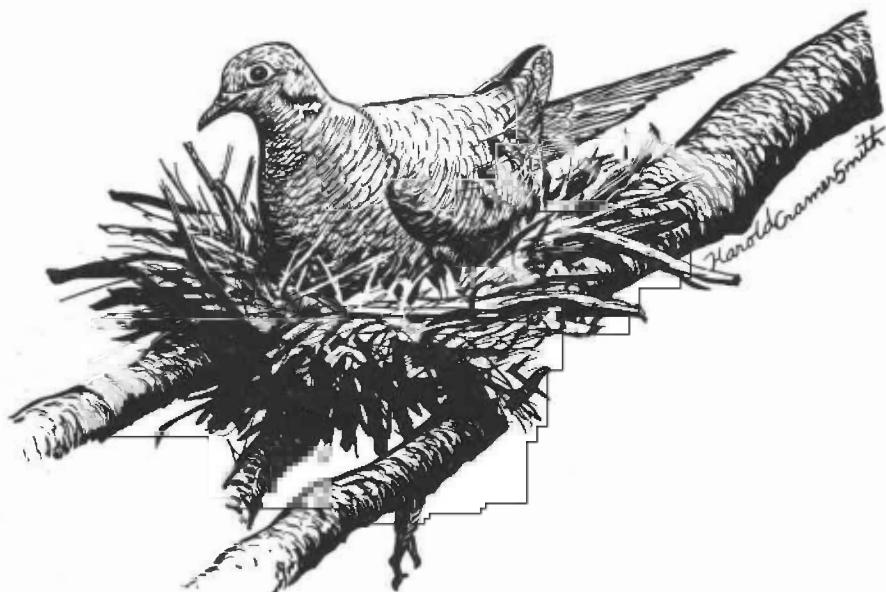

Roadside counts during mid-August are summarized in Table 19.

More doves wintered in western Oregon, according to results of the quadrat survey. The 1967 average of 22.4 doves per 100 acres of habitat in the Willamette Valley almost equaled the high year of 1965. Wintering populations in the Rogue River Valley increased 38 percent over 1966. Comparisons are presented in Table 20.

The annual call count survey was conducted between May 20 and June 10. Results are shown in Table 21. Similar numbers of doves were seen and heard the past two years on the 18 routes sampled.

BAND-TAILED PIGEONS

The preseason inventory at mineral springs and tideflat concentration areas is presented in Table 22.

HUNTING SEASONS

The following table displays 1966 season dates and bag limits.

	Open Season (all dates inclusive)	Open Area	Daily Bag Limit	Possession Limit
UPLAND GAME:				
Mourning Dove	Sept. 1-30	Entire State	12	24
Band-tailed Pigeon	Sept. 1-30	Entire State	8	8
Silver Gray Squirrel	Oct. 1-Oct. 31	Hood River and Wasco Counties		
		*Southwest Area	5	5
	Entire Year	*Northwest Area	No Limit	No Limit
Blue and Ruffed Grouse	Oct. 1-23	Entire State	3	6
Sage Grouse	Sept. 24-25	Deschutes, Crook, Lake, Harney and that part of Malheur Co. south of U. S. Highway 20	2	2
Chukar and Hungarian Partridge	Oct. 1-Jan. 15	*Eastern Oregon	8	16
Cock Pheasants	8:00 a.m. Oct. 22-Nov. 27	Eastern Oregon except Klamath Co.	3 (a)	12 (a)
		Western Oregon and Klamath Co.	2	8
Valley and Mountain Quail	8:00 a.m. Oct. 22-Nov. 27 8:00 a.m. Oct. 22-Jan. 15	*Western Oregon *Eastern Oregon	10	20

(a) One hen pheasant may be included in the daily bag or possession limit in Malheur County from November 19 through November 27.

Questionnaire sampling was conducted following the season. Of the 16,741 questionnaires mailed, 14,687 (88 percent) were returned. Upland game species were hunted by 26 percent of the respondents. Projections of the results indicated that 90,194 hunters bagged 871,512 birds and spent 666,824 days afield. Table 23 summarizes 1966 seasons while Table 24 compares results with past years.

Tables 25 through 33 present the kill by species. Estimates of available habitat by geographic area are provided to arrive at indices of kill per square mile for comparative purposes.

Hunting by juveniles on the E. E. Wilson Game Management Area resulted in the kill of 104 pheasants and 9 quail by 384 participants. The average of 0.3 birds per hunter equals the low success experienced in 1965. A comparison with past years is presented in Table 34.

Results of Oregon's second turkey season are summarized in Table 35. A total of 954 tags was issued for the fall season which authorized taking one turkey. Of the total tag holders, 291 were permitted to hunt for toms only during the spring if unsuccessful during the fall. The average success of 4 percent was low compared with the 16 percent success experienced in 1965 when 290 hunters participated.

Trends in land posting are recorded in Table 36. There has been little change from past years in land access, and less than one-third of the ownerships along 765 miles sampled were posted against hunting during the 1966 season.

GAME FARM OPERATIONS

Game bird production during the 1966 season is summarized in Table 37.

All pheasant hatches except the first were sexed, and cocks only were retained for rearing. The sexing technique proved to be 92 percent accurate. Hatching success averaged 80 percent compared with 70 percent in 1965. Approximately 94 percent of the birds hatched were reared.

The limited chukar production was utilized for release during the hunting season on the Ladd Marsh Management Area. Hatching and rearing success were high, averaging 87 and 97 percent, respectively.

Hatching success for Hungarian partridge improved from 37 percent in 1965 to 63 percent in 1966.

Bamboo partridge egg production improved substantially over 1965 but hatching success remained a low 31 percent. More of the birds were raised, however, with rearing success averaging 55 percent compared with 43 percent in 1965.

Low egg fertility and cannibalism continue to hamper the Kalij pheasant program. Only 27 percent of the eggs hatched but 79 percent of the birds were raised, resulting in some increase available for breeding stock.

Pheasant liberations are recorded in Table 38. The 1966 releases totaled 13,128 in western Oregon and 10,412 in eastern Oregon. Of these totals, 3,157 were liberated as adults in the spring, 8,142 as young during the summer, and 12,241 as adult cocks during the hunting season. Holding pens were operated on the Denman, Klamath, Summer Lake, and Ladd Marsh Management Areas to rear a total of 2,500 cocks from eight weeks of age until released during the season.

Miscellaneous releases included: 505 chukars on the Ladd Marsh Management Area, 70 in Lake County, and 58 in Wasco County; 68 Hungarian partridge in Klamath County, and 24 in Crook County; 198 bamboo partridge in Coos County; and 9 Kalij pheasants in Benton County.

Administration

The waterfowl management program carried out by the Oregon State Game Commission is coordinated with similar programs throughout the Pacific Flyway. Even though management of migratory birds is the direct responsibility of the Bureau of Sport Fisheries and Wildlife, Oregon has a direct obligation of supplying the Service with factual data on the birds while they are in the state. The coordinated program includes periodic census of key areas, a state-wide winter inventory, hunting season results, natural mortality, production surveys, breeding ground conditions, banding, maintenance of waterfowl areas, and habitat improvement.

Weather and Habitat Conditions

The mild winter of 1966-67 was followed by a cool, wet spring which slowed evaporation and preserved water in the major marshes at near normal levels. As a result, heavy stands of vegetation emerged and provided good nesting cover and excellent habitat for rearing broods.

Evaporation losses were light, and by mid-August most marshes and potholes still contained sufficient water to last through the production period.

Production

Excellent goose production resulted throughout the eastern Oregon breeding range. The number of broods and young recorded on established transects indicate an increase in production of 7

Production in 1967 up 7.0 percent from 1966

percent from 1966 and 18 percent from the previous three-year average. (Table 1.)

Since 1956, goose production trends on 24 islands in the impoundment area of the John Day Dam have been measured through annual nest counts conducted by the Washington Department of Game with the assistance of the Bureau of Sport Fisheries and Wildlife and the Oregon State Game Commission. These islands will be inundated with the filling of the impoundment in 1968. Results obtained during this 12-year period are presented in Table 2.

Table 2

1964	140	1958	115
1963	200	1957	177
1962	151	1956	81*

*Incomplete survey.

Good water conditions in all production areas caused a wide dispersal of ducks from permanent water areas to adjacent lakes and marshes. A decrease of 16.1 percent was recorded, with dabblers up 43 percent but divers down 68 percent. (Tables 3, 4, and 5.) Fair to good production of divers is expected, however, as the late spring caused delayed nesting, and the heavy marsh vegetation made an accurate census impossible.

Production estimates by the Bureau of Sport Fisheries and Wildlife for the Malheur National Wildlife Refuge, the major production area in Oregon, was 18,000 ducklings. This is an increase of 38 percent from the 13,000 production in 1966 but 18 percent below the average of the previous five years when habitat conditions were ideal.

Fall Migrations

Weekly tabulations of waterfowl populations during the fall migration period are presented in Tables 6 through 14.

1. Southeastern Oregon

Early duck flights to the marshes in the high desert areas were down 50 percent from similar flights in 1965. No large concentrations were observed but periodic flights were recorded passing through the area until the last week of November.

Northern migrant geese arrived on normal dates and in numbers comparable with previous years. Snow geese, however, arrived at Summer Lake in much larger numbers than in 1965. A good percentage of each flight was composed of young birds while a year ago very few immatures were present.

2. Northeastern Oregon

The first large movement of mallards to the Columbia Basin wintering area in Oregon did not occur until mid-November, a week later than in 1965. The population has been declining in size annually since peak numbers were reached in 1962.

Canada goose flights also show a similar decline. They, too, apparently are wintering in the Columbia Basin project area in eastern Washington.

3. Western Oregon

Waterfowl numbers reached a peak during the first week of November and remained static in numbers throughout the winter. Mallards from the prairie provinces apparently dropped off in the upper Columbia Basin, as they did not arrive on their traditional wintering areas along the lower Columbia River and in the Willamette Valley in numbers comparable with prior years.

*Peak of 3 white-fronted geese on Sept. 23; 5 gadwalls on Sept. 27; 20 shovelers on Oct. 10; 1 snow goose on Oct. 21; 15 buffleheads on Oct. 31; 75 lesser scaups and 25 blue-winged teal on Dec. 17.

Banding

During the year waterfowl banding operations were conducted at six sites by the Game Commission and at three sites by the Bureau of Sport Fisheries and Wildlife. Banding was carried on primarily during the preseason and postseason periods to mark samples of predominate species for determination of hunting mortality distribution and migration patterns.

A total of 4,688 ducks, 96 geese, and 111 coots was banded in the state. All ducks and coots banded at Summer Lake, Sauvie Island, Denman Area, Cold Springs Refuge, and Malheur Refuge were taken in bait traps. Geese were captured by drive-trapping, while wood ducks and hooded mergansers in Benton, Klamath, and Jackson Counties were incubating females caught in nest boxes. The number and species of waterfowl banded at each site is tabulated in Table 15.

Recoveries from these bandings and bandings of previous years are shown in Table 16. Oregon-banded waterfowl were recovered in 15 states, 7 Canadian provinces or districts, and in Mexico.

During the 1966 season Oregon hunters reported recovering the following number of banded waterfowl: 882 ducks, 196 geese, 3 brant, and 1 coot. These birds were banded in 12 states, 5 Canadian provinces or districts, and on Wrangel Island, U.S.S.R. The returns by state or area of banding are given in Table 17.

A summary of the direct returns of preseason banded waterfowl is presented in Table 18. Hunting pressure on the mallard remains high, especially on public hunting areas. Approximately 20 percent of those banded on state areas were reported killed during the season, while only 5.6 of those banded on Malheur National Refuge and 7.2 on Cold Springs National Refuge were bagged.

Recovery rates are relatively high at Summer Lake and Sauvie Island as bands are collected at check stations. Recovery rates at each management area, however, are comparable with returns of previous years.

Hunting Season

The 90-day waterfowl season opened on October 8, 1966 and terminated January 5, 1967 except in the Columbia Basin counties of Baker, Gilliam, Malheur, Morrow, Sherman, Umatilla, Union, Wallowa, and Wasco, where the season was extended on ducks and coots through January 15. In these nine northeasteren Oregon counties shooting was permitted until one-half hour after sunset.

The brant season extended from November 28 through February 15 and the snipe season from October 22 through December 10.

The bag limit was increased from 4 ducks per day and 8 in possession in 1965 to 5 and 10 for the 1966-67 season. Except for 2 wood ducks and 1 hooded merganser per day, no other species restrictions were in effect. In the nine Columbia Basin counties the daily bag limit was 6 ducks and the possession limit 12.

Goose bag limits remained the same as in prior years. Six geese were permitted daily or in possession providing at least 3 in the daily bag were snow geese. One Ross' goose could be part of the daily bag or possession limit.

The brant bag limit was 3 daily or in possession; coot, 25 daily or in possession; and snipe, 8 daily with a possession limit of 16.

Harvest

In spite of the reduced fall and winter waterfowl populations, Oregon hunters enjoyed the most successful season since 1959. Duck hunting was good on migrants through October and November but dropped off sharply in December and January when hunting was confined to a relatively small population of wintering birds. Goose hunting remained good throughout the season on both migrant and wintering flocks.

Results of the annual random mail survey indicate that hunting success was up nearly 25 percent, with 435,995 ducks and 54,615 geese taken compared with 348,997 ducks and 43,654 geese bagged in 1965. The number of waterfowl hunters also increased from 44,470 to 49,790, the first indicated increase in waterfowl hunting since 1958 when the downward trend started. Daily success also improved with hunters averaging 1.3 ducks and 0.17 geese per day. See Table 19.

Very few hunters took advantage of the extended season and larger bag limits in the nine Columbia Basin Counties. Success remained low due to lack of hunting sites, low population of wintering birds, and relatively mild weather.

Hunting success and hunting pressure on five public hunting areas also increased over the previous season. Summaries of the results are presented in Tables 20 and 21.

Age classification of 2,979 snow geese shot at Summer Lake showed 508 adults to 2,471 birds of the year, a harvest rate of one adult to each six young. This is only an indication of an excellent production year in the Arctic and not a true age classification. General field observations revealed an age ratio of 2 adults to 3 juveniles.

Winter Inventory

The annual mid-winter inventory was conducted during the first week of January and revealed the smallest number of waterfowl wintering in the state since 1952. Only 252,753 ducks and 47,984 geese were counted as compared with 417,563 ducks and 68,039 geese in 1966. See Table 22.

Much of the decrease occurred among mallards, widgeons, and pintails in wintering areas along the Columbia River and in western Oregon.

Overall, the waterfowl population was down 34 percent, with ducks down 39 percent and geese down 29 percent. Brant were up 91 percent, swans up 33 percent, and coots up 1 percent.

Black Brant

During the 1966-67 brant season, which extended for 80 days between November 28, 1966 and February 15, 1967, only 1,523 brant were wintering in Oregon. Two hundred twenty-seven stayed on Yaquina Bay and 1,296 on Tillamook and Netarts Bays.

Because of the small local populations and the need for special decoys and equipment, few hunters participated in this specialized type of hunting. Only 23 hunters were checked during the season. They had bagged 14 brant in 78 hours of hunting for a success of .60 birds per man-day.

Snipe

In western Oregon, trends in the number of migrant snipe are measured in conjunction with the upland game census. Results obtained are expressed in birds per 100 acres of habitat and are tabulated with the censuses of the previous four years in Table 23.

On the breeding grounds of northeastern and southeastern Oregon where 20-mile pheasant crow count samples traverse snipe habitat, the number of snipe seen and heard is also recorded. On 280 miles of established transects, 245 snipe were observed as compared with 136 in 1966. (Table 24.)

FUR BEARERS

A drastic decrease in all raw fur prices since the period immediately following World War II has resulted in fewer trappers taking to the fields and marshes each winter. During the 1966-67 trapping season only 879 residents obtained trapping licenses. This included the landowner, who obtained a free license, as well as the general trapper. The rate of decline has been steady from the peak total of 2,681 in the 1946-47 season.

The 1967 legislature added the wolverine to the list of animals classified as furbearers, with the Game Commission promptly providing complete protection throughout the year. Nine animals are now classified as furbearers with seasons provided for the taking of seven. Fishers are the other species provided with year-around protection.

Seventeen animals, however, produce fur of commercial value, with most of the trapping effort directed toward the taking of beaver, otter, mink, and muskrat.

BEAVER AND OTTER

The season for the trapping of beaver and otter extended from November 15, 1966 through February 15, 1967 in all counties except Grant, Lake, Malheur, and Harney. In these four counties a November 1 opening was authorized to permit trapping of high country before snow and cold weather prohibited entry or made operation of a trap line difficult.

During the season, trappers purchased 12,021 beaver seals at \$1.00 each. They reported using 9,878 on beaver and submitted most of the balance for refund.

The catch of beaver, otter, and other fur-producing species is presented by county in Table 1.

Census

A census of 12 one-mile samples on 12 streams in Douglas County indicate a significant increase in beaver. Eighty-three slides, 15 dams, and 32 dens were tallied as compared with 69 slides, 7 dams, and 27 dens in 1966.

Damage

During the year, 210 complaints of beaver damage were received and acted upon. Some dead-trapping and live-trapping was conducted by Commission personnel to remove nuisance animals, but most of the complainants remedied their own problems through use of repellents or kill permits. Many deferred action until the trapping season opened when a private trapper trapped the sites for fur.

Table 2 shows the number and disposition of beaver complaints by region for the last three years.

OTHER FURBEARERS

Fur Catch

Eight hundred thirty-nine (86 percent) of the 879 licensed trappers submitted reports of their fur catch. They reported catching a total of 51,900 fur animals of 17 species whose pelts sold for \$174,597.98. Some additional animals were taken by the non-reporting group and children under 14 years of age who were not required to obtain a license or file a report of their catch.

Nutria and opossum, two illegally introduced species, continued to increase and spread through western Oregon. Some trapping effort was directed toward these species, however, when a market developed for the largest and best quality pelts. But in general the animals trapped were accidentally taken in sets made for other species.

Fur Values

Trappers received 33 percent less for their furs during the 1966-67 season than they realized the previous winter. All species of fur were down in value, with the long-haired furs showing the greatest decline. Mink and muskrat values are now comparable to depression day prices.

The average prices received for all furs, as compiled from trappers' report cards, are presented in Table 3.

Table 3
AVERAGE PELT PRICES

Species	1966-67	1965-66	1964-65	1963-64	1962-63

Muskrats (Summer Lake)

With a stable water level in the Summer Lake Marsh for the past two summers the muskrat population showed a rapid recovery. The population was still too low, however, to supply a surplus for harvest. No muskrats have been cropped from the area in the last three winters.

Comparative house counts and harvest data for the last 10 years are presented in Table 4.

Table 4
SUMMER LAKE MUSKRAT CENSUS AND HARVEST

Predators

The control of predatory and nuisance animals in Oregon is a co-operative effort participated in by several private, county, state, and federal agencies. The program is administered by the Division of Wildlife Services of the U. S. Fish and Wildlife

Service and operates on funds supplied by these agencies.

Control work is confined to those counties which appropriate funds to the program. Eight counties (Clatsop, Hood River, Jackson, Lake, Multnomah, Polk, Sherman, and Tillamook) did not participate.

Since repeal of the state bounty law in 1961 many of the counties have also discontinued payment. Only 15 of the 36 counties continue the bounty system of predator control. (Table 5.)

Table 5
ANIMALS BOUNTIED BY COUNTIES

County	Coyote	Bobcat	Wolf	Other
Benton	\$ 7.50 5.00 (pups)			Red Fox Adult \$3.00 Red Fox Pup \$1.00

Wheeler	3.50	2.50		
Yamhill				Gopher \$.15 Mole \$.15

A recent change in federal predator control policies shifted the emphasis from a general control program to a control of specific nuisance or destructive animals. Since this change in policy, no figures on the total predator take have been released.

An accelerated program of predator control on problem game ranges was continued, however, with emphasis on the removal of coyotes and bobcats from antelope kidding grounds, bighorn sheep areas, turkey release sites, and deer winter areas.

Coyote populations remain high throughout the state, with the heaviest concentrations located in northeastern and northwestern Oregon. Numbers of predators observed on big game census routes are recorded and shown in Table 6, with the number of coyotes also expressed in animals per thousand miles of travel.

Table 6
PREDATOR POPULATIONS

Region	Miles of Census	Coyotes	Bobcats	Foxes	Coyotes per 1,000 Miles
Northwest	2,095	39	11	5	18.6
Southwest	2,042	8	2	4	3.9
Central	1,299	14	0	0	10.8
Northeast	1,825	43	3	0	23.6
Southeast	1,802	16	0	0	8.8
TOTAL	9,054	120	16	8	13.3

A check of Jackson County bounty records revealed the following number of animals bountied during the last five years.

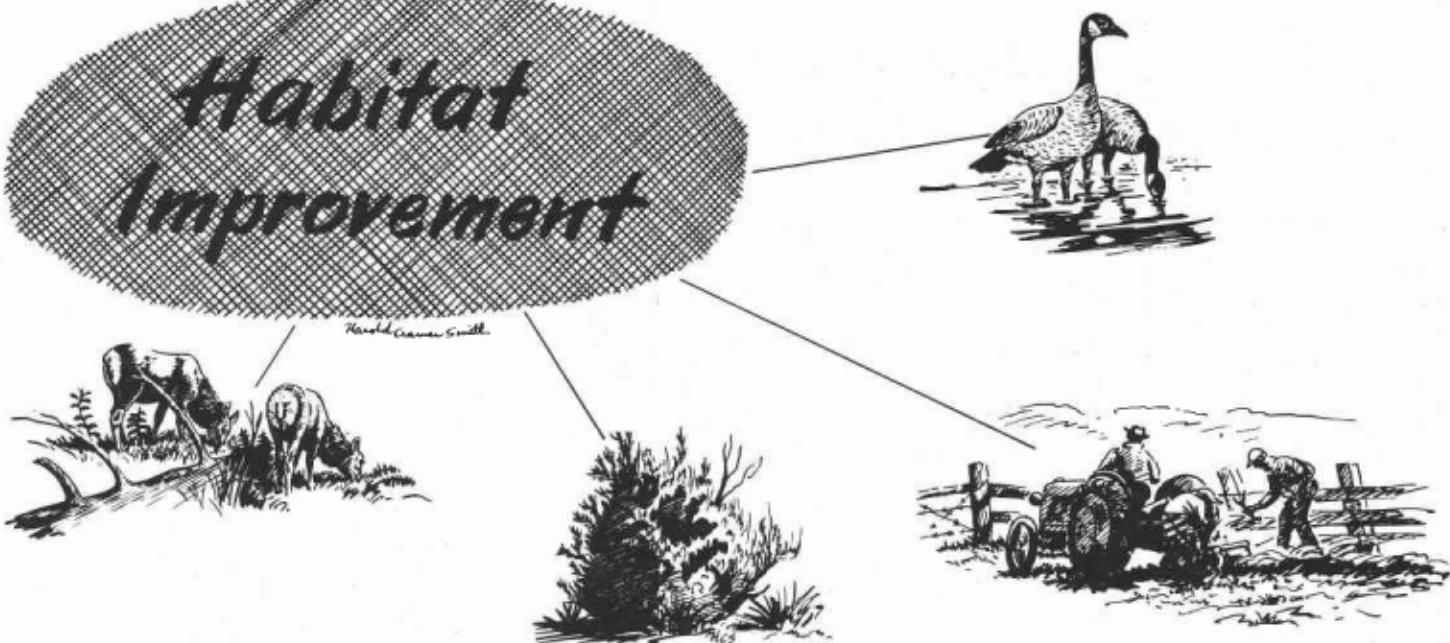

PREDATORS BOUNTIED
(Jackson County)

Species	1966	1965	1964	1963	1962
Coyote	778	707	728*	538	504

Fox	100	76**	-	-	-
Cougar	1	0	0	0	0

* Coyote bounty raised to \$7.50 from \$5.00. Government hunters discontinued.

**First year bounty paid on fox; \$3.50.

Habitat Improvement

The objective of this program is to increase or enhance game habitat. This is accomplished by providing food, water, and cover where one or more of these essential items is missing. Big game and waterfowl developments are initiated primarily on public lands. Upland game bird habitat improvements are made primarily on private lands. Public access to these lands is obtained by written agreement with the landowners. The developments made to improve wildlife habitat are cover plantings, herbaceous and browse seedings, upland game cistern installation, big game water hole and cistern developments, waterfowl nesting site and dike erection, and fencing to protect new developments or existing prime habitat.

Cover Plantings

Thirty-seven acres of block shrub and tree plantings were made on 22 sites in the Columbia Basin. Tree and shrub plantings were substantially reduced by unavailability of planting stock. New plantings were additionally reduced by the need for replacement of young plants lost due to drought in plantings made in 1966. Of the 40,975 trees and shrubs planted, 21,085 were replacements. Four thousand two hundred fifty multiflora roses were utilized in making replacements on eight sites in Wasco, Jefferson, and Crook Counties.

By autumn, plant survival was extremely poor in Union and Baker Counties. Three-leaved sumac had only 5 percent survival. American plum and black locust had 20 percent survival. Honeysuckle and wood rose exhibited 70 percent survival, but plants were stunted. In contrast, growing conditions in the spring of 1967 were very favorable, and until July 1 only a few scattered plants had been lost.

Tables 1 and 2 list details of plantings.

Table 1
TREE AND SHRUB PLANTINGS BY SPECIES AND COUNTY

Species	COUNTIES						Total		
	Baker	Crook	Jefferson	Lane	Morrow	Umatilla	Union	Wasco

County	Number of Sites	Acres	Number of Plants
Morrow	7	23	11,630
Umatilla	7	10	4,635
Union	8	4	3,425
Totals	22	37	19,690

Five new ten-year cooperative agreements were signed for habitat improvement developments on private land. These agreements provide access to over 17,500 additional acres for hunting.

Habitat developments were also made, or are in progress, under memorandums of understanding and other agreements on lands of the State of Oregon, Bureau of Land Management, U. S. Forest Service, Bureau of Reclamation, Weyerhaeuser Timber Company, and Pacific Power and Light Company.

Annual agreements were signed with 17 cooperators in the Willamette Valley for the planting of Sudan grass in rye grass fields... opening 467 acres on 55 fields to upland game and waterfowl hunting.

Table 3
TEN-YEAR AGREEMENTS WITH PRIVATE LANDOWNERS

County	New Agreements in Effect	**Sites Completed		Acres Newly Opened to Hunting
		66-67	Total

Totals	5	288	989	17,500+

* Total acreage open.

**Completed sites require no further cultivation and have permanent grass cover sown between shrub rows.

¹ Renewals.

In Sherman County, which has extensive upland game bird cover

developments, maintenance and evaluation checks were made in the summer of 1966 on all habitat projects. Little maintenance was required; however, annual checks for maintenance are necessary to protect investments. Increases in wheat allotments could mean the loss of some developments in Sherman County. However, no losses have yet occurred as a direct result of this change in the wheat program.

Evaluation trend counts were made for the 11th year on six samples totaling 18 miles, and for the 10th year on twelve samples totaling 33.5 miles. No counts were made in 1964 and 1965. The following table represents the game observed on these samples by year from 1954 through 1966.

Table 4

Herbaceous and Browse Seedings

One hundred forty-seven sites totaling 2,819 acres were seeded during the past year. Upland game and waterfowl food and cover plantings totaling over 880 acres were made on 100 areas.

The most extensive food plantings for pheasants and waterfowl were made at Fern Ridge Reservoir where cooperators seeded 150 acres of Sudan grass and 18 acres of corn. Thirty acres of Sudan, 7 acres of barley, and 4 acres of corn were planted there by habitat personnel. In the Willamette Valley, 17 cooperators also contract-planted 467 acres of Sudan grass on 55 sites for upland game and waterfowl use. On the fresh water areas in the coastal sand dunes south of Florence, 60 acres were seeded cooperatively with both the U. S. Forest Service and the Bureau of Land Management to grain, grass, and legumes for waterfowl, pheasants, and black-tailed deer. On Commission-owned Patch and Porter Islands in Malheur County, 60 and 25 acres, respectively, were seeded to barley and wheat for waterfowl and pheasant use. At Prineville Reservoir, 26 acres of the exposed lake bottom were fall seeded to wheat for green feed for waterfowl. With Forest Service cooperation, Wickiup Reservoir was fall seeded to grain for fall goose use. At Sauvie Island, trial plantings of self-perpetuating aquatic food plants were disked to reduce the number of plants, and the millets were sprayed to eliminate weeds.

Grass seedings were made in 23 established shrub plantings in Morrow, Umatilla, and Union Counties to provide permanent nesting cover for upland game birds.

Utilization of food plantings is excellent. Last fall, waterfowl consumed 90 percent of the barley planted at Florence. At Fern Ridge Reservoir, waterfowl use was substantial. Over 7,000 ducks were observed at one time in Sudan and corn plantings. At Patch and Porter Islands, geese kept spring planted grain mowed to ground level well into early summer.

More emphasis is continuously being placed on big game range seeding. Trial seedings are established at every opportunity to obtain valid information for large-scale plantings. Over 20 of the seedings made for big game were of this nature. The most extensive trials were on the Deschutes National Forest. Various combinations of four wing saltbush, bitterbrush, wheat grasses, alfalfa, and Sainfoin were planted on 19 sites. At Tumalo Reservoir, a 12-acre trial was established for the 900-acre abandoned reservoir site. The trial area was sprayed with 2,4-D in June 1966, drilled to crested Siberian and pubescent wheat grasses in September, and broadcast seeded with nomad alfalfa in March 1967. In Lake County, eight acres of a brush beating eradication trial at Hole-in-the-Ground were seeded with four wing

saltbush and Sainfoin. In Klamath County, a 10-acre juniper chaining and seeding trial was made on the Goodlow deer winter range. Junipers were dozed to simulate chaining. Trial species planted included bitterbrush broadcast in juniper root cavities; bitterbrush, wedge-leaf Ceanothus, and wheat grass drilled before and after dozing; and saltbush and nomad alfalfa broadcast seeded in April 1967. At Palomino Buttes on the Dry Mountain deer winter range, two one-acre trials were made of saltbush and Sainfoin. The Bear Ridge trial in Tillamook County consisted of aerial broadcast seeding of winter-active Harding grass, and white and sub clovers on burned portions of cutover timber lands. At Summer Lake in Lake County, a two-acre trial planting of saltbush and Sainfoin was established. A two-acre saltbush trial seeding was also made on Bureau of Land Management lands on North Myrtle Creek in Douglas County. Near Prineville Reservoir, wheat grass seed was added to a five-acre trial of saltbush and alfalfa. On the Ochoco National Forest, wedge-leaf Ceanothus seed was broadcast on 2.5 acres of disturbed soil near logging slash, and one acre on a sprayed silver sage stand was drilled to Sainfoin and saltbush seed.

Many extensive big game seedings were also made. One thousand acres of the Barnes pasture juniper chaining area on the Camp Creek deer winter range were drilled with bitterbrush seed. Also in Crook County, 50 acres were drilled to saltbush and Sainfoin at Steens and Dagus Lake. On the Ochoco National Forest, bitterbrush seed was broadcast seeded with an erosion control grass mixture on 274 acres in three ranger districts. A portion of each of the three seeding sites was also seeded to bitterbrush with the Hansen browse seeder to determine the feasibility of broadcast seeding disturbed areas in this manner. The 200-acre Plainview burn in Deschutes County, which was sprayed with 2,4-D in the spring of 1966, was drilled to wheat grass in November and broadcast seeded with alfalfa in March 1967. At Prineville Reservoir, seven sites totaling 45 acres were drilled with various combinations of wheat grasses, alfalfa, saltbush, and Sainfoin. One hundred acres of newly burned soil on Winter Rim in Lake County was cooperatively seeded with the Fremont National Forest to Dutch white clover on moist sites and to nomad alfalfa on the drier sites. Fifty acres of skid roads and disturbed areas in the Tool Box burn, also on the Fremont Forest, were cooperatively seeded with bitterbrush. Table 5 lists all big game seedings.

Other practices undertaken to stimulate browse and herbaceous growth for big game included fertilizer application and bulldozing. In Douglas County, five tons of 16-20-0 fertilizer was applied cooperatively with the Bureau of Land Management to 20 acres of big game winter range on Upper Hubbard Creek. On Bear Ridge in Tillamook County, 30 acres of clear-cut land were

similarly fertilized. On Upper Mountain Meadow, a deer and elk winter range in the Umpqua National Forest, high skirted willows and serviceberry were cut off two feet above ground level to promote basal sprouting and 20 acres of 50-foot-wide strips were bulldozed through dense brush stands in preparation for fall seeding. In Grant and Lake Counties, mahogany regeneration and rehabilitation projects were undertaken. In the Canyon Creek drainage of Grant County, ground cover was removed from soil adjacent to mahogany with good seed crops to allow seed to reach mineral soil. Mahogany in thick stands was opened to allow sunlight and moisture to penetrate the closed canopy and some mahogany was pushed over to stimulate sprouting. Approximately 60 acres of mahogany were treated on this project. In Lake County, several hundred yards of narrow lanes were dozed through heavy old growth stands on the Crooked Creek deer winter range.

Morrow	Shrub Plantings	7		Perennial grass
Polk	Rye Grass Fields	5	28	Sudan grass
Umatilla	Shrub Plantings	7		Perennial grass
Union	Shrub plantings	9		Perennial grass

Seedings are visited frequently to evaluate their success. At Prineville Reservoir, browse and herbaceous seedings are being utilized extensively by local deer. Four-wing saltbush seeded there this spring looks promising. Extensive trial seedings of Sainfoin, a legume used extensively in Europe, were made throughout eastern Oregon. Very encouraging observations were made in Deschutes, Harney, Crook, Lake, Klamath, Grant, and Wallowa Counties. Sainfoin greens up as early as crested wheatgrass and is winter active during mild winters and is used extensively by mule deer where it has been planted in Idaho. On the Ochoco National Forest, observations were made on several seedings. Wedge-leaf Ceanothus in and around slash piles made an excellent emergence; however, there appeared to be no evidence of the influence on this germination by the burning of the slash. The drilling of bitterbrush and Ponderosa pine in the clear-cuts resulted in an excellent emergence of bitterbrush and a fair emergence of pine. An inspection of the broadcast erosion seedings on logging disturbance where bitterbrush was included revealed encouraging results. Numerous plants were observed, and broadcasting on sites of severe logging disturbance at this time appears most practical.

Cooperation by the Prineville District of the Bureau of Land Management gave the Game Commission its first opportunity to make large-scale bitterbrush seedings on the Camp Creek deer winter range. This was also the first opportunity to evaluate the effects of juniper chaining and revegetation on deer winter ranges. Seedings of grass and bitterbrush are making very noticeable improvement in growth. The drilling of 1,000 acres with 700 pounds of bitterbrush in January and February of 1967 in the Barnes pasture chaining exhibits nearly phenomenal emergence for this species.

Deer are still attracted to the chainings in large numbers during January, February, and March. The downed junipers still living are providing much deer forage. Cattle and deer are feeding on seeded grass, bitterbrush, and released native grasses, forbs, and shrubs. The following table gives the results of 20 one-tenth-acre deer pellet group transects read in the spring of 1965, 1966, and 1967. The transects designated controls are in adjacent standing juniper nearly identical to the chained areas prior to chaining.

Table 6

Year	CHAINED AREA			CONTROL AREA		
	No. Samples	No. Deer Pellet Groups	% of Total Use	No. Samples	No. Deer Pellet Groups	
1965	10	316	75	10	105	
1966	10	816	70	10	351	
1967	10	690	82	10	153	

An inspection was made after two growing seasons of bitterbrush drilled with crested wheatgrass on the Cold Springs brush spraying and seeding. Bitterbrush was drilled from two openings of the rangeland drills seeding wheatgrass. This planting procedure seeded bitterbrush on 380 acres of the 2,000-acre spray project. A fair stand of bitterbrush with plants up to six inches tall can be found on most of the seeded area. The first and most critical spring after seeding was one of the worst for several years.

In Lake County, brush beating and seeding practice in the vicinity of Cabin Lakes Guard Station has thus far exhibited poor results. Also in Lake County, high desert tract counts on 109 one-mile samples and controls to evaluate BLM range rehabilitation practices were again read at Hampton. No significant changes in wildlife numbers are yet apparent. Seedings are being utilized extensively by jack rabbits. Caged alfalfa plants average 15 inches high, whereas uncaged plants average only 5 inches in height.

In Klamath County, the seeding trial in the Pokegama, to test the adaptability of plants for use in that area, was evaluated after two growing seasons. Topar pubescent wheatgrass, greenar intermediate wheatgrass, Sainfoin, and nomad alfalfa were the species demonstrating the greatest potential for use in that area. Plans are to drill 1,000 acres in the fall of 1967 using pubescent, intermediate, and Siberian wheatgrass and nomad alfalfa and Sainfoin.

The South Goodlow juniper chaining and revegetation trial in Klamath County demonstrates high potential for this practice. Excellent initial stands of wheatgrasses and bitterbrush have been obtained. Some emergence was observed also on four-wing

saltbush and wedge-leaf Ceanothus. In June of 1966, seven one-tenth acre deer pellet group transects to measure deer trends in relation to this practice were established and read. Transect #1 is located within the trial area, and the other six transects are located in juniper stands where this practice is anticipated. The transects were again read in June of 1967 after the chaining trial. Pellet group numbers indicate a substantial increase in deer use on the chained area.

Table 7
GOODLOW PELLET GROUP TRANSECTS

Transect Number	Pellet Groups	
	1966	1967
1*	19	77
2	58	54
3	33	37
4	16	20
5	38	37
6	32	51
7	43	68

*Transect located in the chained area.

Upland Game Bird Cisterns

Twenty-seven self-filling cisterns were installed at new locations in the Columbia Basin, Baker, and Harney Counties. Aluminum roofing water collecting aprons and Fiber-glas water holding and drinking troughs were made by habitat personnel. Seventeen cisterns placed in Morrow and Umatilla Counties are primarily for pheasant use. Two cisterns placed near Brownlee in Baker County and eight installed in the Alvord area of Harney County are for chukar utilization.

Four old inoperative concrete cisterns in Umatilla County were buried and replaced with Fiber-glas cisterns. Five Fiber-glas cisterns were removed from Alkali Lake, Lake County, where no use developed. These units were issued to the Lakeview District BLM for installation in the North Warner area. In Sherman County, one cistern was moved to a new location and one unused cistern in Crook County was removed for future use. All cisterns were inspected and maintenance performed where necessary.

Big Game Water Holes and Cisterns

Water developments are made on public lands cooperatively with the U. S. Forest Service and Bureau of Land Management. Materials were supplied to BLM for the development of 10 springs on BLM lands. Development consists of installing water collecting pipes, boxing, piping to watering troughs, fencing the water source and seeding permanent grasses in the fenced areas. Four springs were developed in Catlow Valley in Harney County and six in the Warner and Juniper Mountain areas of Lake County. One of the Lake County units involves the use of a 4,000-gallon storage tank for a spring that dries up in late summer. The tank will store excess water for dispersal during the period of no flow to insure a season-long water supply.

Three new excavated water holes were constructed by habitat personnel on the Deschutes Forest; one on the Crescent District and two on the Sisters District. Three other existing water holes north of Sisters were enlarged and deepened. Five tons of bentonite, supplied by the Forest Service were applied to the eight water holes in this locality to reduce seepage loss.

Eight catchment-type big game cisterns were installed cooperatively with the Ochoco and Deschutes National Forests; five on the Snow Mountain District and three on the Crescent District. All big game cisterns are maintained annually. Float valves are removed in the fall before the freeze-up and re-installed in the spring. Extensive repairs were made to the three water collecting aprons crushed by snow on the Snow Mountain District.

1966 BIG GAME WATER DEVELOPMENTS

County	Cooperating Agency	Type of Development	Number	Total in Use
Deschutes	USFS	Cistern	3	23
Deschutes	USFS	Water Holes	3	8+
Harney	USFS	Cistern	5	7
Harney	BLM	Spring	4	35*
Lake	BLM	Spring	6	40*
TOTALS			21	113+

*Includes developed water holes.

Waterfowl Nesting Sites and Dikes

Placement of wood duck nest boxes was continued. Boxes deteriorate and are destroyed by vandals. Trees on which they are placed blow down, and are cut down by beaver and cottonwood loggers. Consequently, at least every five years it is necessary to place new boxes on old sites. This year 205 boxes were erected in eleven counties as shown in Table 10.

Table 10
WOOD DUCK NEST BOX PLACEMENT

TOTALS	205	3,068

Five bulldozer-built nesting islands were constructed on Howard Prairie Reservoir in Jackson County. Vegetation planted for erosion control was kept grazed off by waterfowl and it was necessary to install log booms around the islands to decrease erosion from wave action.

One replacement and six new goose nesting platforms were constructed at Prineville Reservoir. Nine of the twelve platforms on the reservoir were used by nesting Canada geese in 1967. Waterfowl utilization of Prineville Reservoir has steadily increased since the initiation of food and nesting developments on this area. The following table represents the duck and goose days of use recorded in the month of June on the reservoir since 1963.

Table 11
PRINEVILLE RESERVOIR WATERFOWL USE DURING JUNE

Year	Duck Days of Use	Goose Days of Use
1964	420	780
1965	1,500	1,200
1966	1,500	1,800
1967	4,250	4,650

At Fern Ridge Reservoir in Lane County, two hundred fifty yards of small dozer-built dike were constructed to impound winter runoff water. One new small pond was constructed, and on three existing nesting ponds the canary grass and cattails smothering the ponds were removed.

Fencing

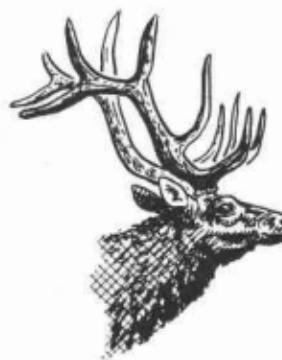

Erection of fencing is necessary in many areas to protect shrub plantings and upland bird cisterns from livestock use. Over 700 rods of fencing were used to protect 10 shrub planting sites in Union and Umatilla Counties. In Umatilla County four fence stiles were constructed to provide better hunter access and to protect fences.

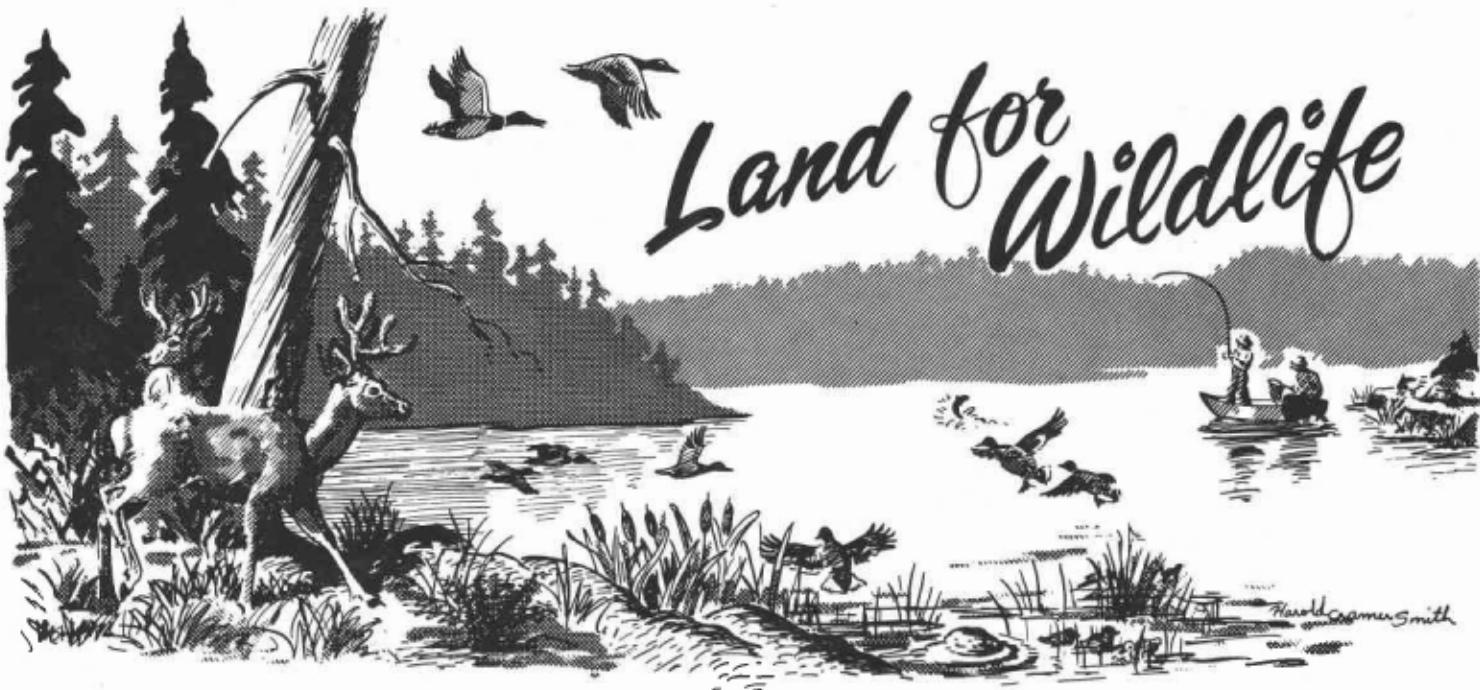

Fencing is also necessary to regulate livestock grazing on range

rehabilitation projects. Eleven hundred seventy-eight rods of fencing (3.7 miles) were constructed for this purpose. Trespass cattle made necessary the cooperative construction of 880 rods of fence around the 200-acre Plainview burn seeding in Deschutes County. One hundred ninety-three rods of three-strand barbed wire suspension type fence were constructed around the Goodlow Mountain and Tumalo Reservoir seedings. Thirty-five rods of deer-proof fence were also erected on the Goodlow area to determine the effect of deer browsing on new seedings. The right-of-way flagging for the $5\frac{1}{2}$ -mile livestock fence on the Pokegama deer winter range was completed and fence construction was initiated.

Fencing to control summer and fall livestock use on big game browse winter ranges increases substantially the amount of browse available for deer winter use. During the year, cooperative fencing plans have been made with the Bureau of Land Management, U. S. Forest Service, and Weyerhaeuser Timber Company for fencing, within the next year, portions of the Silver Lake, Gearhart, Eastside Steens, Pokegama, Goodlow, and Murderer's Creek deer winter ranges.

At Prineville Reservoir, fluctuating water levels and human use make fence maintenance to exclude livestock a routine task. However, results are beginning to show. Once bare shore lines now have considerable growth of native willows and other vegetation. Several older fences surrounding shrub plantings in Sherman, Umatilla, and Morrow Counties received major repairs.

Wildlife Lands in Management Areas

Seventeen land acquisition and development projects have been initiated since 1942. Most projects have received federal assistance through the Pittman-Robertson Act and Public Law 537.

Three of the project areas are being developed primarily for big game, five for waterfowl, three for upland game, and the remainder for a combination of waterfowl and upland game use. Project areas total 109,650 acres of which 60,112 acres have been purchased to date, while 26,668 acres are controlled under lease or agreement. The remainder remains in private ownership, making it difficult to exercise efficient control and management.

During the period from July 1, 1966 through June 30, 1967, 250 acres in the Klamath Management Area were purchased at a cost of \$124,000. Also during this same period, an exchange in the Summer Lake Management Area with an adjacent private owner resulted in an increase of 12 acres for that area at no cost. In addition, 67 acres in the E. E. Wilson Management Area were turned over to the U. S. Air Force. Expenditures for all land purchased to date total \$2,895,041, while the cost for lands leased totals \$2,660 annually.

ORS 496.340 specifies that certain real properties, exclusive of improvements, administered by the Game Commission are subject to county taxes. These include most of the project areas listed with the exception of military lands. Taxes and assessments during the year totaled \$50,461.10

Table 1 summarizes the status of land management projects, followed by a detailed account of activities on the respective areas.

Table 1
WILDLIFE LANDS

Area	Date Initiated	Project Area		Cost	Purchased to Date		Lease or Agreement		Annual Cost	Taxes & Assessments

¹ Conveyed by U.S.A. to State with restrictions under Public Law 537.

² Public domain withdrawn from disposal and reserved for wildlife and recreational use.

³ Executive order reserving land for wildlife use.

⁴ Management agreement with B.L.M. making lands available primarily for wildlife use.

SAUVIE ISLAND

In 1947 the Game Commission initiated acquisition of the northern half of Sauvie Island in order to preserve and develop wintering grounds for waterfowl and to provide an area for public hunting. The project area encompasses 12,129 acres, of which 11,073 acres have now been purchased or are under long-term lease from the State Land Board. No additional land purchases were made during the year.

Development and Maintenance

A 15 c.f.s. propeller pump was installed at the northwest corner of the Columbia Drainage District dike to provide early fall water for normally dry lake beds within the diked area. Water was brought to the pump site by excavating an 850-foot-long ditch from Little McNary Lake. A power line to the site was constructed by P.G.E.

The McNary water control in the A-1 canal, which was damaged by high water, was reconstructed. Three large culverts were also installed in the ditch to provide sites for vehicle crossings.

Three and one-half miles of fence were constructed around the Lyons tract to exclude cattle from wildlife croplands. An additional 1,000 rods of fencing around various tracts on Sauvie Island were replaced, and 140 rods replaced on Government Island. Eight hundred forty additional rods of fencing was repaired.

The legislative refuge around Mouse Island Lake and Little Sturgeon Lake was re-surveyed and permanently posted.

A total of 544 acres was planted to wildlife food crops and left standing for winter waterfowl use. Acreages were as follows: Buckwheat, 246; corn, 100; proso millet, 80; Jap millet, 20; spring barley, 36; and fall barley, 62. No crops were planted on Government Island due to a prolonged spring freshet which kept the island inundated through the spring months.

Recreation

A survey was conducted to assess the total annual recreational activity on the Sauvie Island Management Area. It shows the importance of the area as a multiple use recreational site.

The number of recreational man-days for the one-year survey totaled 201,208. Sightseeing was the major activity, with

nearly 31 percent of the total use. Angling accounted for more than 43 percent of the use and was equally divided between river fishing for anadramous species and lake fishing for warm-water fish.

Public hunting, one of the primary purposes of the area, ranked fifth among the recorded activities with only 5 percent of the total use.

Hunting

A total of 11,310 hunters checked through the checking stations and bagged 17,362 ducks, 314 geese, 79 coots, 801 pheasants, and 1 quail. Hunting success by unit is presented in the following table.

SAUVIE ISLAND
HUNTING SUCCESS BY UNIT

Unit	Waterfowl & Pheasants	No. of Hunters	Birds per Hunter-Day		
			1966-67	1965-66	1964-65
McNary	5,259	3,608	1.46	1.49	1.59
Sturgeon	5,102	3,116	1.64	1.69	1.66
West	7,153	3,781	1.89	1.93	1.69
Racetrack Blinds	730	509	1.43	2.10	1.56
Oak Island Blinds	313	296	1.06	1.19	1.29
TOTALS	18,557	11,310	1.64	1.69	1.63

On Government Island, waterfowl hunting was permitted for 20 hunters on Wednesdays and Sundays from November 14 to January 5. Two hundred twenty-two hunters obtained permits and bagged 830 ducks, 2 geese, and 8 coots, for a success of 3.8 birds per man.

Tables showing waterfowl populations, banding results, and hunting success are presented in the waterfowl section of this report.

SUMMER LAKE

In 1944 the Game Commission initiated purchase of land for the Summer Lake Management Area with primary objectives of developing and maintaining habitat for waterfowl and providing an area for public hunting. The area now controlled totals 17,321 acres, with 11,865 acres purchased, 1,505 acres leased, and 3,963 acres withdrawn for wildlife use. Twelve acres were added to the project during the year through a land exchange with a private landowner.

Development and Maintenance

Two 10,000-gallon water tanks which furnish domestic water for the headquarters area were razed and replaced with a 30,000-gallon metal standpipe.

The majority of buildings on the area were painted during the summer months.

Wind and water caused considerable erosion to some of the unprotected dikes and necessitated a great deal of maintenance work. One thousand yards of rock and gravel were used to repair the damage.

Twelve nesting islands were constructed in the marshy areas on the Delameter tract.

Three hundred acres were seeded to cereal crops for wildlife use. Three acres were planted to pubescent wheat and 73 acres of established alfalfa were maintained.

Strip farming was continued on the larger fields to control wind erosion and facilitate the control of weeds on the fallowed strips.

The cereal crops received only light use by waterfowl during the past year because of the open winter, light yield, and heavy predation by blackbirds.

Two cuttings of alfalfa, totaling 172 tons, and 92 tons of wild hay were harvested and sold to local ranchers.

Biological

Much of the biological work conducted on the area during the year is summarized and presented in the waterfowl and furbearer sections of this report. Included are periodic waterfowl

inventories, production success, hunter success, species composition of waterfowl bagged, results of banding programs, and muskrat inventory and harvest.

KLAMATH

In 1949 the Game Commission initiated action to acquire 7,656 acres of land in the Miller Island area, six miles southwest of Klamath Falls, for a waterfowl management area. To date, 2,761 acres have been purchased and an additional 2,410 acres are under long-term lease. The remaining land within the project boundaries is in private ownership and remains to be acquired. Six hundred three acres were purchased in two tracts and added to the management unit in 1966.

Development and Maintenance

A new 750-gallon concrete septic tank was installed at headquarters to replace the 650-gallon metal tank which disintegrated and collapsed.

The foundation under the back porch of the Gregory house was rebuilt, the Delameter barn painted, and the irrigation pump-house re-roofed.

One-half mile of dike along the Klamath River was riprapped with 850 tons of 12-inch minus rock, and one-half mile of dike on the Delameter tract reconstructed. Three-eighths mile of dike on the B. B. Hooper tract was rebuilt.

A new 12-inch irrigation pump was purchased to replace the broken down 10-inch pump on the Delameter tract.

Four hundred ten acres were seeded to spring wheat and barley and 65 acres were planted to common rye and winter wheat last fall. Intensive grazing by spring migrant geese resulted in over 50 percent of the fall seedings.

Eighty acres of alfalfa were fertilized, irrigated, and harvested. The hay produced was sharecropped, and fertilizer purchased with the revenue. An additional 300 acres of alfalfa and pasture lands have been acquired with the purchase of the Hooper and Largent tracts.

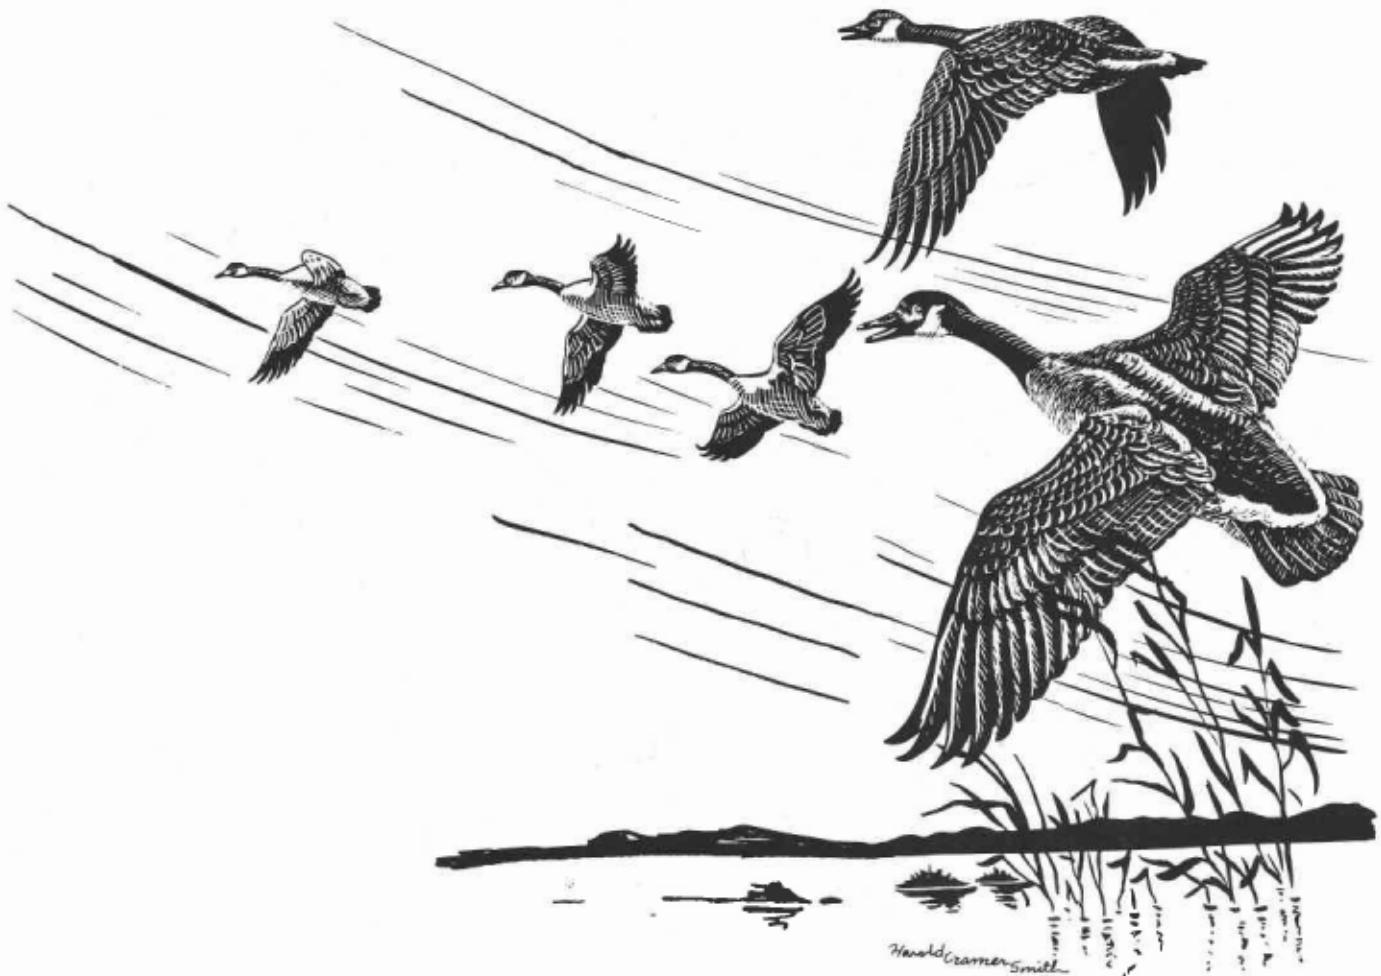

Biological

Early fall utilization of standing grain by ducks and geese was heavier in the fall of 1966 than it has been since 1958. Over half the grain remained, however, for the spring migrants.

The peak number of spring migrant waterfowl occurred around March 1, when 140,000 snow geese, 50,000 white-fronts, 14,000 cacklers, and 800 honkers were using the area. Only 3,000 to 4,000 ducks used the fields during this period.

A total of 91 duck broods of eight species was counted on a two-square-mile section of the area in mid-July.

During the hunting season, 8,908 hunters were counted on the area, with 1,681 checked for hunting success. They had bagged 2,264 ducks, 41 geese, and 394 pheasants for an average success of 1.6 birds per man.

CAMAS SWALE

Land acquisition for the Camas Swale Management Area was initiated in 1942. To date, 2,522 acres of the 2,700 acres in the project area have been acquired. No new tracts were added to the project during the year.

Development and Maintenance

Three one-half-acre ponds were excavated in the southwest corner of the project. They will be filled by surface runoff or by pumping.

All ten ponds on the area were cleaned and water levels maintained during the fall and winter months by surface runoff or pumping.

The pump at the main irrigation well was lifted and 15 feet of pipe added to the column. The additional depth should provide ample water for irrigation of wildlife food crops and filling of impoundments.

Three hundred seventy acres of wildlife food crops were planted and left standing for waterfowl use. Included were 65 acres of corn, 304 acres of Sudan grass, and 1 acre of buckwheat and millet. An additional 15 acres of corn which was not utilized last winter was left for use during the coming year.

Biological

Waterfowl hunting was permitted on Wednesdays and Sundays from November 16 through January 5 for a limited number of hunters. Although 10,000 ducks wintered on the area, the 272 hunters had relatively poor success, bagging 304 ducks for an average of 1.12 birds per day.

LADD MARSH

Acquisition of land for the Ladd Marsh Management Area was initiated in 1949 and now totals 2,252 acres of the 3,747 acres in the project area. No new land holdings were acquired during the year.

Development and Maintenance

The Powell house was sold and moved from the area. The south Evans house, six outbuildings, and the Powell barn were razed and burned.

Eight and one-half acres of open water were created in the marsh unit by constructing 2.3 miles of 30-foot-wide canals through dense stands of cattails. The spoil banks and pushups made excellent nesting and loafing sites for waterfowl.

Three ponds were excavated in steep areas on the Peebler tract and three on the Frank Counsell tract. One-half mile of ditch was constructed to divert water to impoundment sites, and two miles of existing ditch were cleaned.

One mile of old fencing was removed from recently acquired tracts and one-fourth mile of new rail fence was constructed. Five fence stiles were erected to provide hunter access.

Seven sites were worked and planted to 2,830 trees and shrubs for wildlife food and cover.

One hundred eight acres of wheat and 50 acres of barley were planted by sharecroppers and left standing for wildlife use.

Many additional small acreages throughout the area were planted to rye, grasses, clover, sunflowers, millet, vetch, and alfalfa.

Biological

Forty valley quail were transplanted from the John Day Valley.

Eight goose nesting platforms were constructed in the marsh unit, bringing the total on the area to 20.

Sixty-four adult geese were observed during the nesting season but only five broods were located.

Waterfowl populations and hunter use remained high through the extended waterfowl season. In March an estimated 3,350 ducks resided on the area and completely utilized all of the unharvested grain.

As in previous years, pen-raised pheasants and chukars were released periodically through the open hunting season. A total of 1,092 pheasants and 493 chukars was released, with bag checks indicating an excellent harvest of birds.

WHITE RIVER

The White River project was initiated in 1953 to provide winter range for a migratory herd of black-tailed deer and to alleviate a serious damage problem on winter wheat. Approximately 17,000 acres of land adjacent to the east boundary of the Mt. Hood National Forest is involved in the project, of which about 14,000 acres have been acquired to date. An eight-foot-high fence is being constructed to hold both deer and elk off private lands and irrigated and dry land pastures are being improved for game use.

Acquisition

No additional land was acquired during the year.

Development

Two hundred acres of cultivated land were seeded including 40 acres of irrigated pasture planted to alfalfa, clover, and grass, and 160 acres of dry land planted to intermediate wheatgrass and dry land alfalfa. Included in the seedings were five-acre trial plantings of lava vetch and Sainfoin.

Three hundred Vinca plants were hand planted along irrigation ditches on the Cody tract. Old skid roads, and disturbed areas on 1,200 acres of logged and burned lands were hand seeded to bitterbrush and orchard grass, and 300 acres on Happy Ridge were drilled to bitterbrush.

Some thinning of yellow pine was done by personnel from the Wasco County Boys' Camp.

Wildlife

No trapping or tagging was accomplished as mild weather made it impossible to capture either deer or turkeys.

BRIDGE CREEK

The Bridge Creek project was initiated in 1962, and 7,300 acres have been acquired of the 15,375 proposed for purchase. Elk and mule deer are the primary species to benefit from rehabilitation and management of the benchlands involved.

Acquisition

No additional land was acquired during the year.

Development

Nine new ponds were constructed and one pond was enlarged.

One three-way study enclosure was constructed.

Eighty acres of land were prepared for seeding and 1,700 lodgepole pine and 25 hawthorn seedlings were planted.

Wildlife

An elk trap was constructed and operated but mild weather precluded success.

WENAHIA

The Wenaha project was initiated in 1953 to provide winter range for deer and elk. This area is located near Troy in northern Wallowa County and consists of steep slopes and benchlands at the confluence of the Wallowa and Grande Ronde Rivers. Approximately 10,510 acres have been acquired to date of the 17,652 proposed for purchase.

Acquisition

No additional land was acquired during the year.

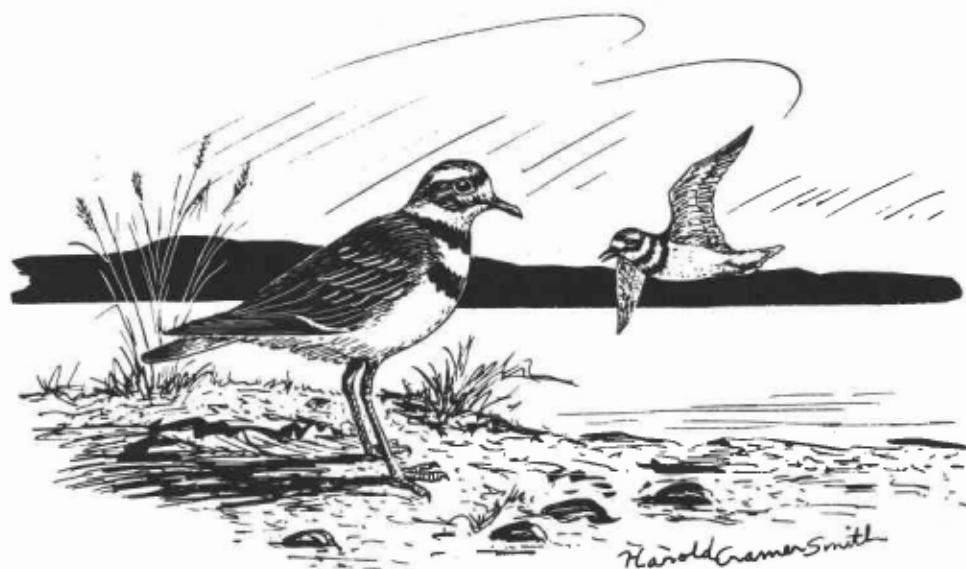

Development

Thirty acres on the Cummings tract were plowed and seeded to

grass and legumes. Seven acres on the headquarters tract were seeded to rye.

Wildlife

Some hay was fed to elk on Eden Bench as a damage control measure.

E. E. WILSON

The E. E. Wilson Area consists of approximately 1,600 acres obtained under conditional title through the General Service Administration. In addition to its main function as a game farm, the area also is used for juvenile hunting, dog training, and field trials.

Game Bird Production

Bird production in 1966 totaled 23,544 pheasants, 799 chukars, 200 Hungarian partridge, 351 bamboo partridge, and 46 Kalij pheasants. Details are presented in Table 37 of the Small Game section.

Construction and Maintenance

1. Covered runs for the brooder house were replaced.
2. A drain tile was installed along the north side of the brooder house to carry off surplus water.
3. A small shed originally used as a sexing room was moved to the holding pens for use as a storage building.
4. The remaining bridge on the area was removed and replaced with a steel culvert.
5. All wooden lids on the sewer system manholes were replaced with concrete covers.
6. The conference hall was insulated.
7. All buildings were maintained as necessary.

Farming and Habitat Development

1. Approximately 28 acres of corn and 42 acres of Sudan grass were planted in 17 plots and left standing for upland game and waterfowl use. Farming was done through land use agreements. The Sudan crop was normal but corn production was poor. Utilization of the food crops was estimated to be 70 percent.
2. Two adjacent landowners farmed the larger fields on a share-crop basis and, in addition, seeded the food plots to corn and Sudan grass. The Commission received 75 tons of wheat under the share program.
3. Noxious weeds were sprayed in compliance with county law and all poison oak was sprayed on the north half of the area.

4. Local Boy Scouts constructed several trails to each of the two newest concrete guzzlers in order to provide access for birds. Soil sterilant was applied to keep the trails free of vegetation.

Recreational Use

Juvenile hunters utilized the area four days while juveniles and accompanying adults hunted an additional four days. A total of 384 hunters bagged 104 pheasants and 9 quail. The pheasant kill was the lowest on record.

Approximately 200 persons used the area for dog training purposes and 200 more attended field trials on the area. Five clubs held ten trials on the area.

HERMISTON GAME FARM

The Hermiston Game Farm, consisting of 182.7 acres, has been sold. The Highway Department acquired 4.87 acres for \$14,750 in November 1965 for right-of-way purposes. Another 5 acres, including a dwelling, were sold to a private party for \$11,250 in February 1966. The remaining 172.83 acres were exchanged for property on Crooked River in April 1967. The value in exchange was \$100,000.

KENNETH DENMAN

The 1,920-acre Denman Area is used primarily for upland game and waterfowl production. Other uses include hunting, angling, dog trials, and dog training.

Game Production

Two holding pens were used for rearing 1,000 cock pheasants from 8 weeks of age until released during the hunting season.

Construction and Maintenance

1. The house and shop were re-roofed and the carport roof was re-tarred.

2. Fifteen yards of granite were placed on the headquarters driveway.
3. Vegetation was removed from the tops of nine quonset huts.
4. Twenty-six yards of large rock were placed in three pond spillways.
5. A parking lot, 80' x 85' was constructed at Whetstone Pond #2 and access provided from the county road.
6. The cattle guard on Agate Road was widened to 15 feet. The steel gate on the quonset hut road was replaced with a cattle guard and the gate was moved to the Military Slough Road.
7. Approximately 1,875 feet of dike below Whetstone Pond #1 were widened to flood six acres.
8. The 3,200-foot Military Slough ditch was sterilized to control vegetation.
9. All ditches on the area, 14 miles of fence, 4 miles of fire-breaks, and toilets, parking lots, and other public use facilities were maintained as necessary.

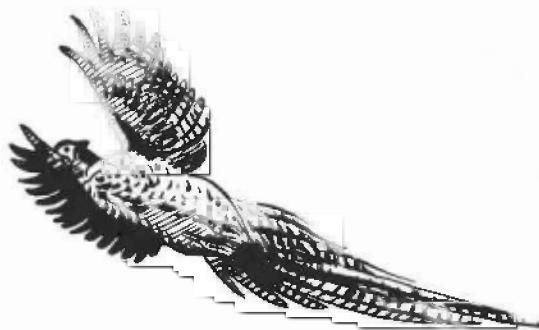

Farming and Habitat Development

1. Two shrub plantings totaling one-half acre were hand cultivated, mulched with 24 yards of sawdust, and fertilized.
2. Thirteen plots, each one-half acre in size, were planted with grass mixtures.
3. Six acres of grass seedings, the headquarters site, and Military Slough ditch banks were sprayed to control weeds.

Recreational Use

The area was utilized nearly every day for spiny ray fishing. Daily hunting occurred from September 1 through the waterfowl season, which ended January 5.

Other recreational uses included field trials, dog training, and picnicking.

SUMMARY OF 1966-67 GAME INVENTORIES

Species	Miles of Census	Number Observed	Average Density ^{/1}			Sex/2 Ratio	Pro- duction ^{/2}	Hunters	1966 Kill	Hunting Recreation ^{/3}
			1967	1966	1965					
Mule Deer	3,667	50,442	13.8	12.4	12.3	12.7	17	76	156,720	88,516
Black-tailed Deer	2,793	12,984	4.6	5.2	4.4	5.9	33	72	114,049	59,459
Subtotal Deer									270,769	147,975
