Beef Progeny Testing Report 1974-1975

Special Report 445
November 1975

Agricultural Experiment Station
Oregon State University, Corvallis

AUTHORS: A. T. Ralston, professor of Animal Nutrition; T. P. Davidson,
assistant professor of Horticulture.

BEEF PROGENY TESTING REPORT 1974-1975

A. T. Ralston and T. P. Davidson

High feed costs and modest beef prices make the exploitation of superior genetic material mandatory for success in the beef cattle business. However, progeny testing (the only positive means of identifying superior genetic material) is costly and a rather slow but sure method of improvement.

Proper conditioning of calves prior to enrollment in the progeny test program greatly improves the accuracy of the data collected and, of course, reduces the cost of the testing program. Furthermore, cattle with a history of disease problems increase disease problems for the rest of the test cattle and do poorly as individuals.

This progeny test period was one of high disease levels with higher than average death losses or removal of test animals from the program. With such losses from a sire group, it is difficult to separate the causes as to environmental or genetic effects. This leaves some doubt in the breeder's mind as to the true value of the sire being tested.

A comparison of average daily gains, live weight per day of age and carcass weight per day of age for six years of testing indicates that this year's performance was at least equal if not slightly above previous tests (Table 1).

Table 1. Summary of six years progeny testing for average daily gains, liveweight per day of age and carcass weight per day of age

Year	Average daily gain, lb		Liveweight/day, lb		Carcass weight/day, lb	
	Heifers	Steers	Heifers	Steers	Heifers	Steers
1969	2.39	2.60	2.08	2.22	1.24	1.34
1970	2.42	2.67	2.22	2.31	1.32	1.41
1971	2.69	2.76	2.24	2.40	1.32	1.46
1972	2.38	2.56	2.15	2.34	1.33	1.42
1973	2.15	2.79	2.23	2.45	1.32	1.46
1974	2.46	2.76	2.21	2.44	1.33	1.49

Each succeeding test has narrowed the variability among sires and within sire groups. This has been accomplished primarily by eliminating the poorer performance animals and having a greater number of animals approach a superior performance.

The rations were the same as in years past (Table 2). Steers were implanted with Sunovex S and the heifers with Synovex H.

Table 2. Progeny Testing Ration

Ingredients	to 650 lbs %	650-850 lbs %	850 to slaughter %
Alfalfa	20.00	15.00	10.00
Beet pulp	7.00	10.00	10.00
Steam rolled barley	54.75	59.25	66.75
Trace mineralized salt	.75	.75	.75
Limestone	.50	.50	.50
Molasses	7.00	7.00	7.00
OSU 40% protein	10.00	7.50	5.00

Two hundred thirty-three cattle from twenty breeders representing four states completed the test. The steers were marketed at 1,081 lbs liveweight which is about 50 lbs less than the previous year but carcass quality was not reduced. The heifers were also about 50 lbs lighter without loss of quality.
