## Abstract

This report presents observations from two programs in 1975, WISP and UP-75 to study circulation off Oregon. WISP was a study of the transition between the winter and spring regimes, and UP-75 was designed to determine whether there is a poleward undercurrent along the continental slope during the upwelling season. During WISP, eleven current meters were moored in three arrays across the shelf at 45°N from late January to late April, and hydrographic sections were made at intervals of several weeks from late January to mid-May. All current meters successfully measured velocity and temperature; ten also measured conductivity. During UP-75, four current meters were moored in an array over the shelf, at the 100 m isobath, and six current meters were moored over the upper slope, at about the 500 m isobath, from late April to late July 1975; all measured velocity and temperature, and four also measured conductivity. At the end of July, there was a hydrographic section across the shelf, both moorings were recovered, and the inshore mooring was replaced with three current meters which were retrieved in September. This data report presents the hourly data from the current meters, including time series of salinity and sigma-t; the hydrographic data; and low frequency time series (with periods longer than one day) of wind, adjusted sea level and the parameters measured from the current meters.

## Introduction

This data report contains observations collected off the Oregon coast under two separate programs, WISP and UP-75. WISP was a program to study the transition between winter and spring oceanographic conditions over the Oregon continental shelf. UP-75 was a continuation of the study of coastal upwelling circulation off Oregon. Both programs included observations from moored current meters and hydrographic sections. Supplementary observations of wind, atmospheric pressure and sea level are also included in this report.

Data from some of the moored current meters included conductivity as well as temperature, pressure, and velocity measurements. These result in salinity time series of sufficient accuracy to yield time series of sigma-t.

The purpose of this data report is to present the processed data and the results of preliminary analysis. In this way the overall results will be generally available although specialized studies of subsets of the data will not be completed for some time.

## The WISP Experiment

Previous observations of the oceanographic regime over the continental shelf off Oregon showed a marked difference between conditions observed in winter and those that prevail in spring and summer (Huyer, Pillsbury and Smith, 1975). In winter, isopycnals are more or less level; currents over the shelf are barotropic and predominantly northward; and sea level at the coast is high. In spring and summer, isopycnals are tilted upward toward the coast; the current is southward at the surface and has a mean vertical shear so that the flow is sometimes northward at the bottom; and sea level is low. The WISP experiment was designed to test the hypothesis that the transition between the winter and spring regimes occurs within a few weeks.

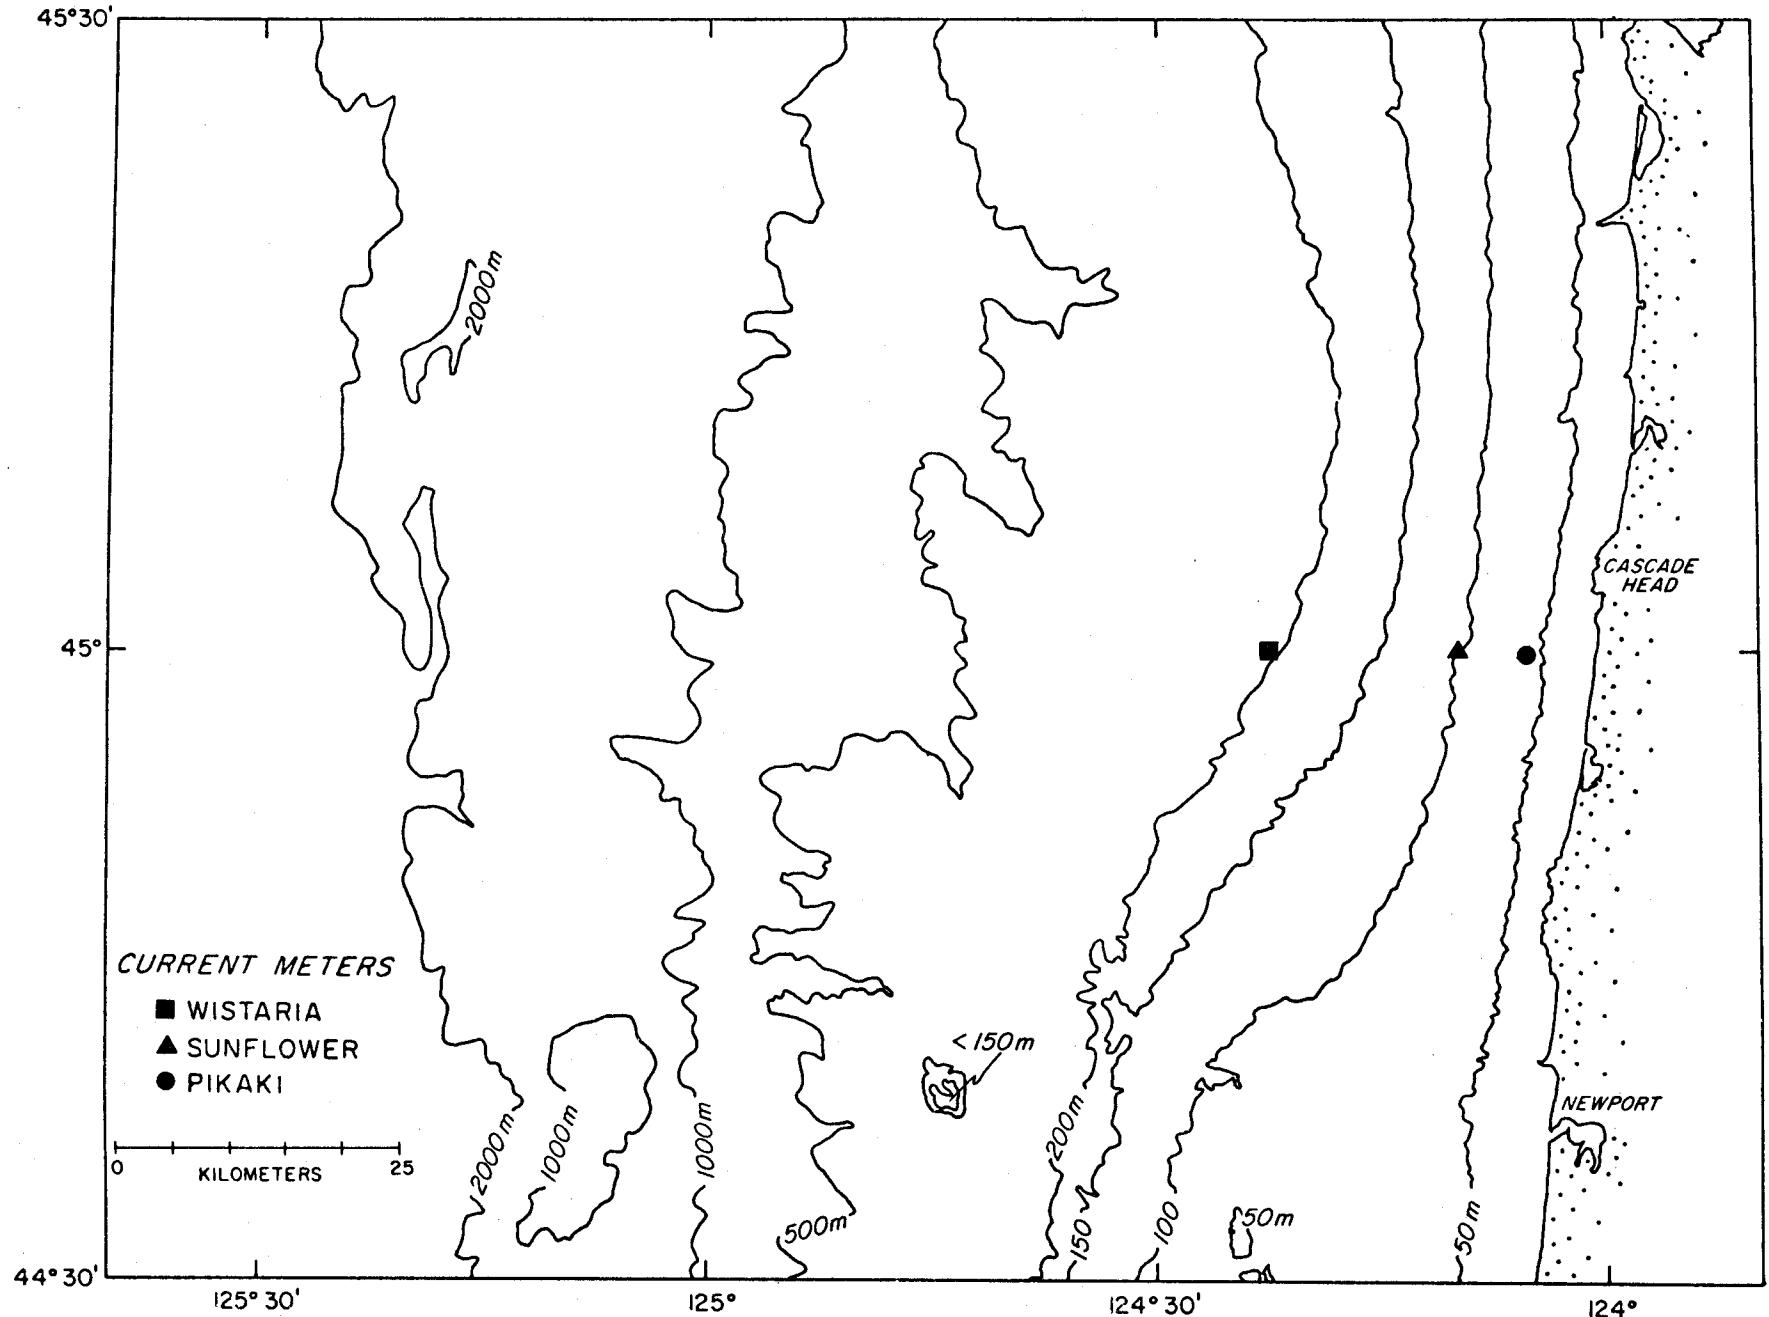

Figure 1. Location of current meter arrays during WISP, January to May 1975.

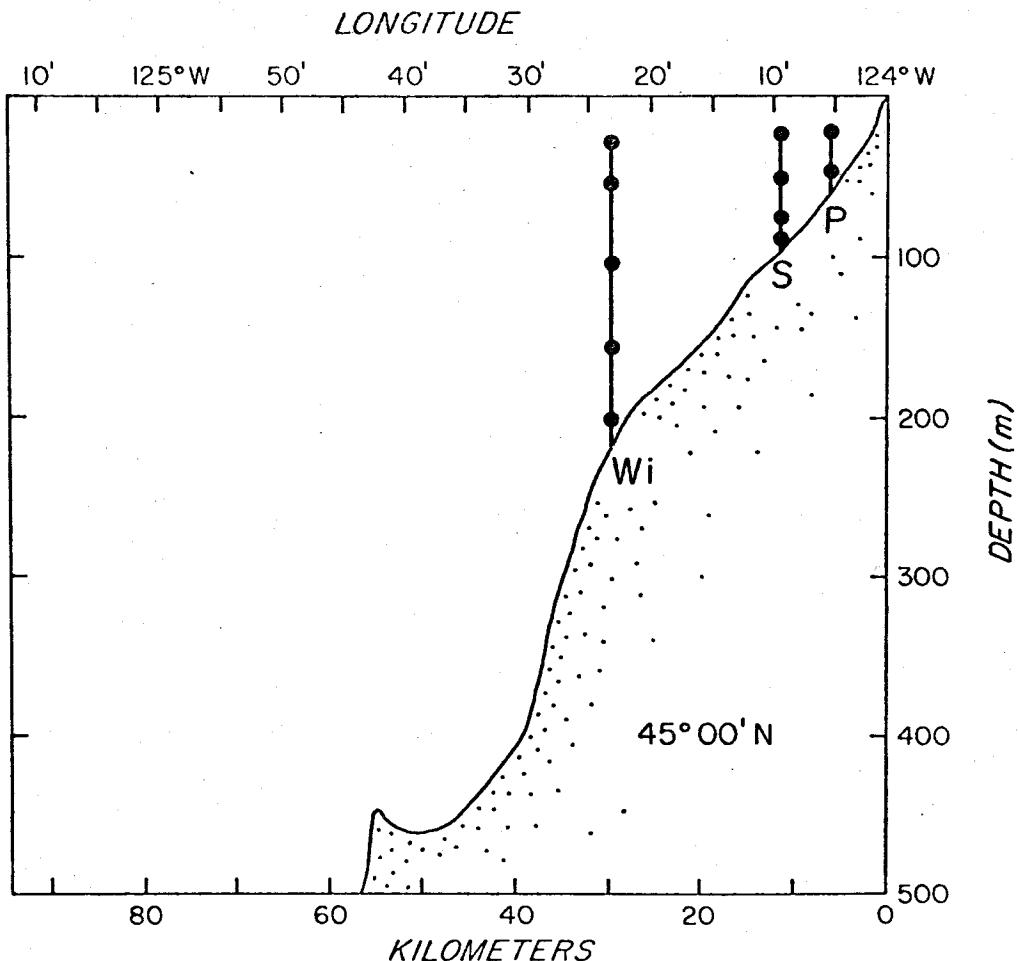

Figure 2. The WISP current meter array and the bottom profile along 45°N.

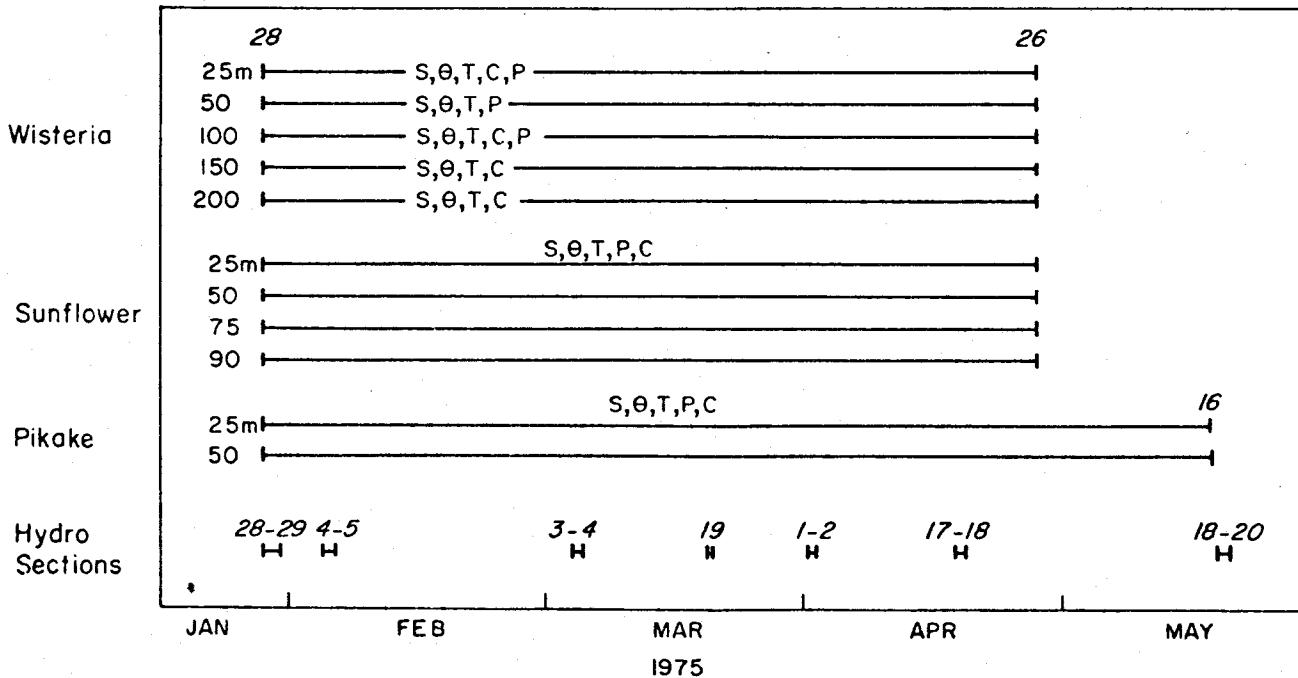

Figure 3. Length of current meter records, and time of hydrographic sections along 45°N, WISP.

Three arrays, with a total of eleven Aanderaa current meters capable of measuring and recording speed, direction, temperature and conductivity were moored across the continental shelf at 45°N in late January 1975 (Figs. 1, 2). Nine of the current meters also recorded pressure. The two offshore arrays, Wisteria and Sunflower, were recovered at the end of April 1975. The nearshore array, Pikake, was recovered in mid-May 1975. The conductivity sensor at 50 m, Wisteria, failed to operate; all other current meter instruments recorded each parameter successfully (Fig. 3). Hydrographic sections with CTD stations about 10 km apart of the shelf were made along 45°N at intervals of a few weeks from late January to mid-May 1975 (Fig. 3).

Simultaneous current observations were made off northern Oregon and Washington by the University of Washington (Hickey *et al.*, 1975) and off Vancouver Island by the Institute of Ocean Sciences, Victoria (Huyer, Gagnon and Huggett, 1976).

#### The UP-75 Experiment

Observations of the coastal upwelling regime in the vicinity of Cap Blanc, Northwest Africa, have clearly shown the existence of a poleward undercurrent along the continental slope (Mittelstaedt, Pillsbury and Smith, 1975). Observations to determine whether a similar slope undercurrent existed off Oregon had not been made in either of the two previous studies, CUE-I and CUE-II, of coastal upwelling off Oregon (Pillsbury *et al.*, 1974 a, b). Observations in these experiments had been limited to the water over the continental shelf and the water above 200 m over the inner slope. UP-75 was designed to test the hypothesis that a poleward undercurrent is present along the Oregon slope, and to learn more about its relationship,

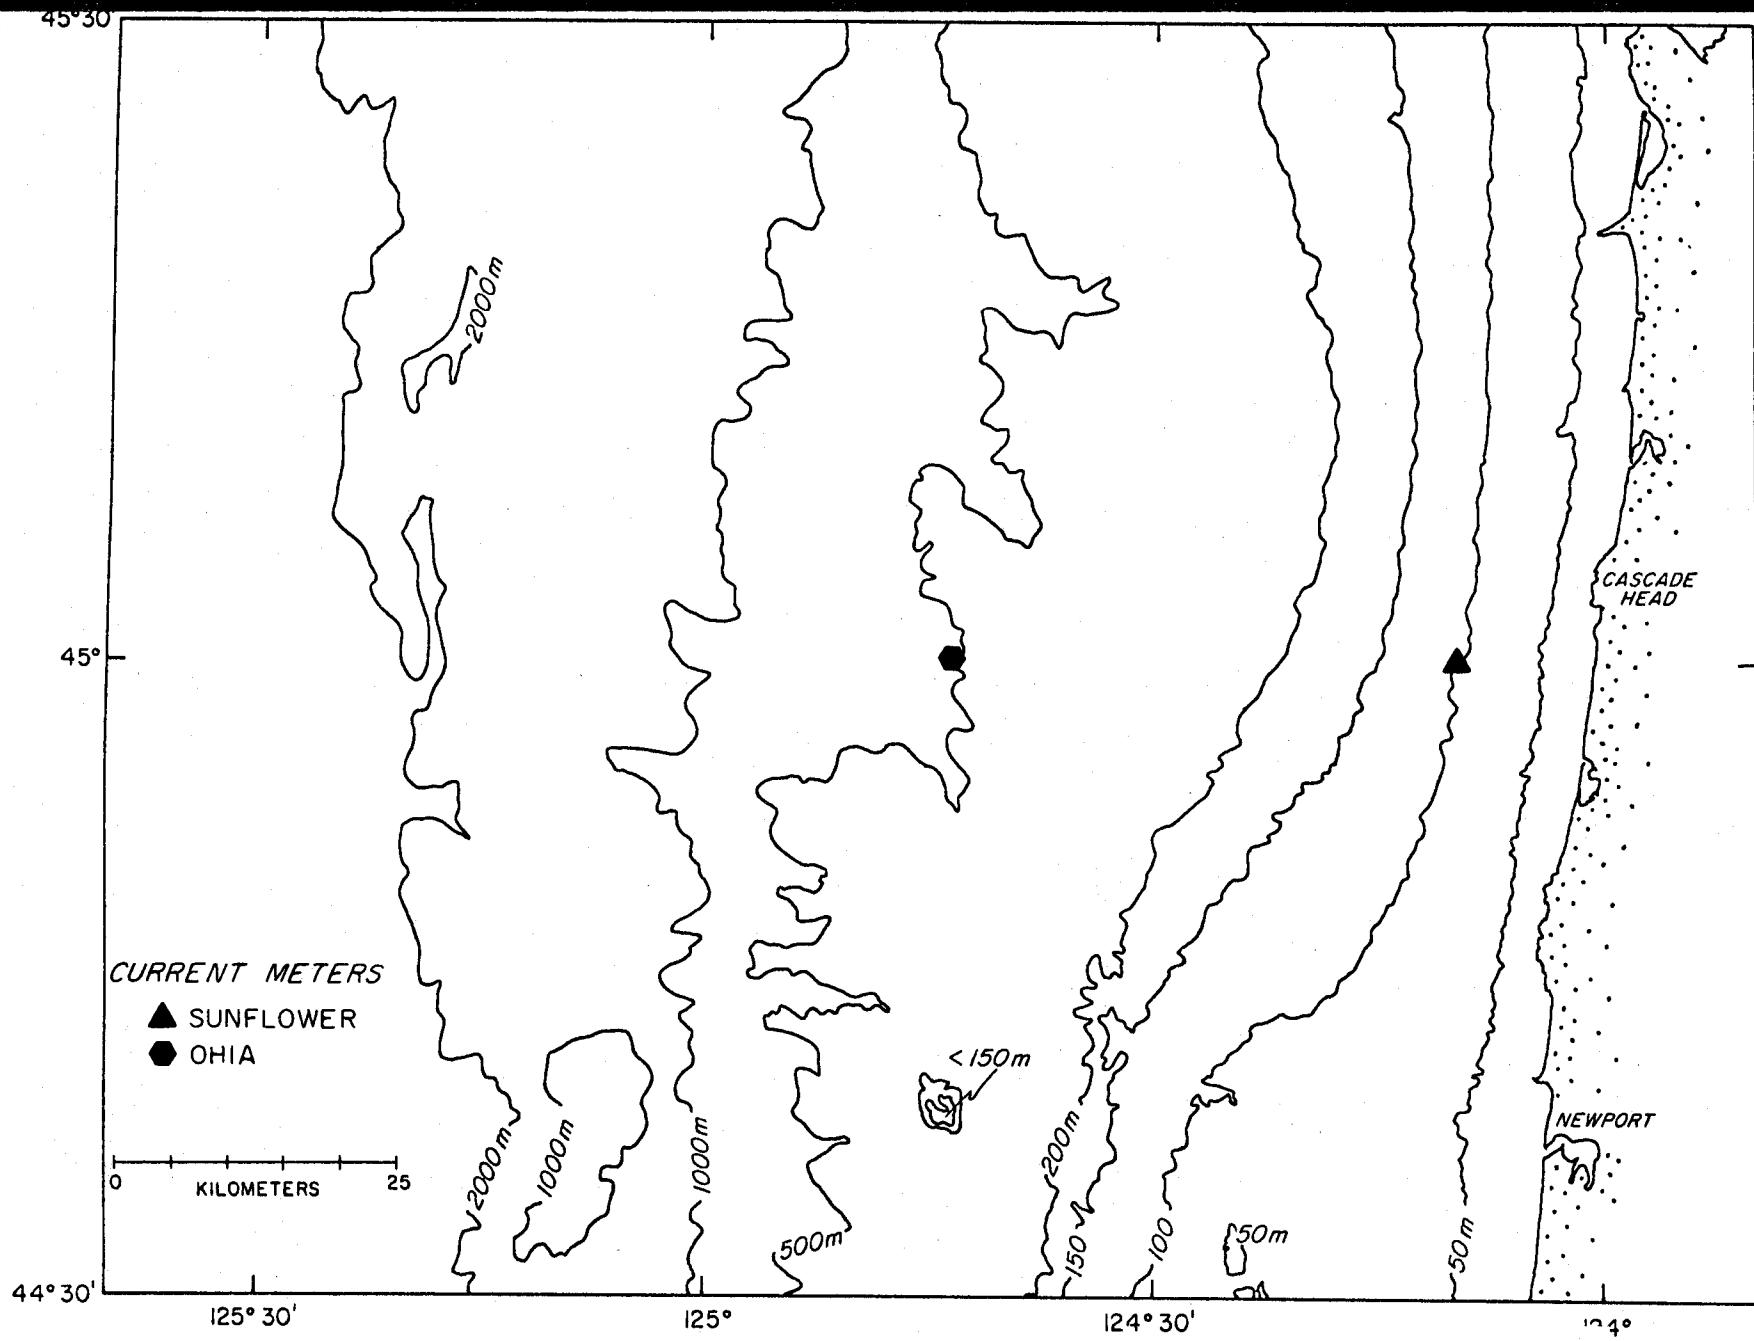

Figure 4. Location of current meter arrays during UP-75, May through July 1975.

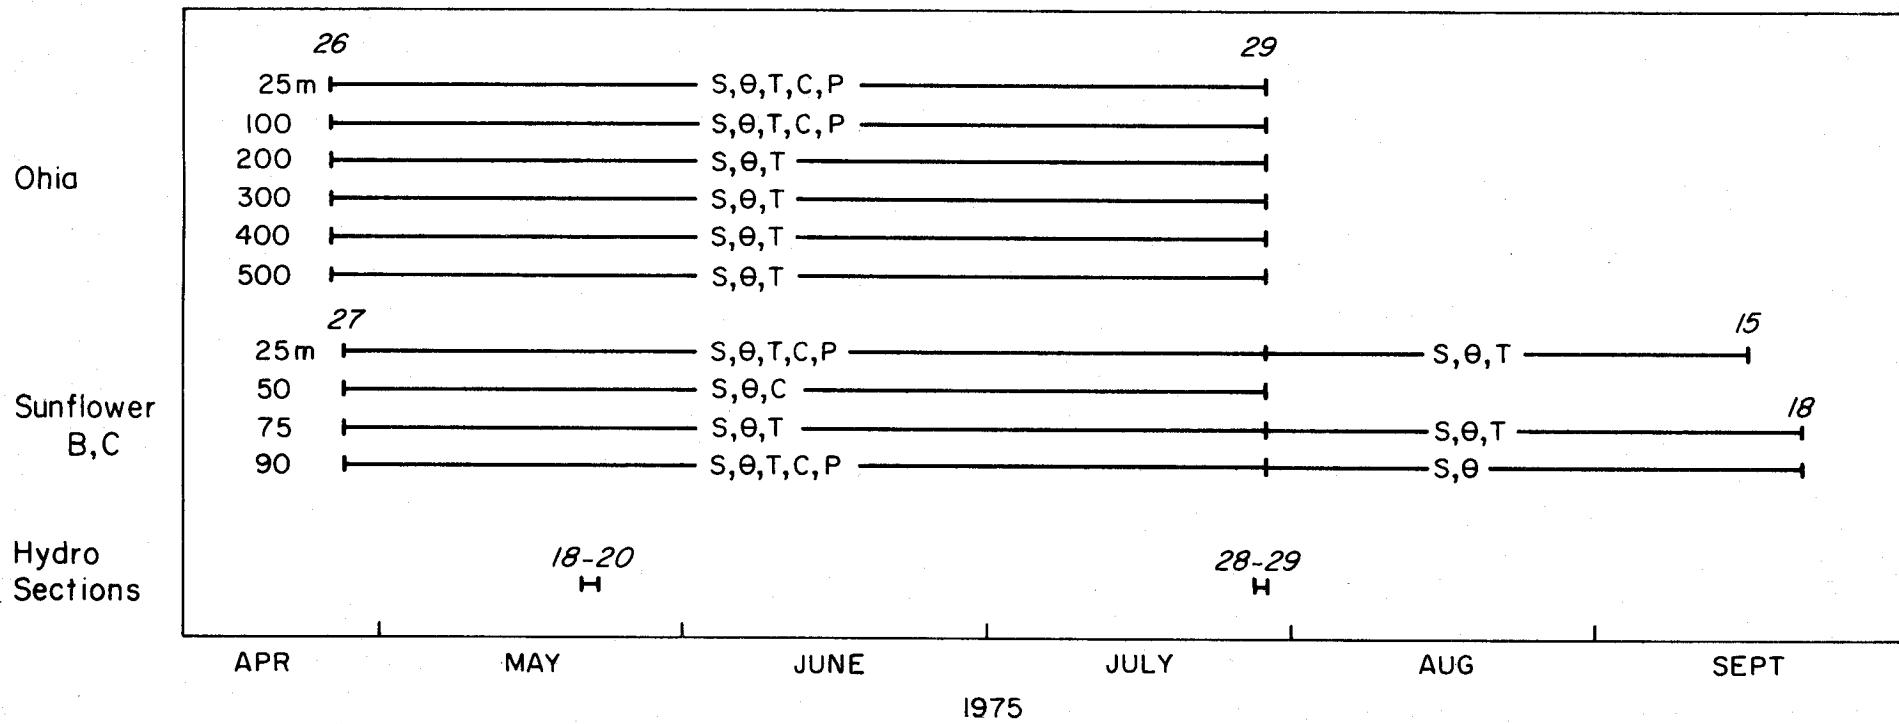

Figure 6. Length of current meter records, and time of hydrographic sections, UP-75.

if any, to the poleward undercurrent that has been observed over the shelf (e.g., Smith, 1974).

Current meters were moored at two locations along 45°N, in about 100 m and 500 m of water (Figs. 4, 5). The deeper mooring, Ohia, was instrumented with six Aanderaa current meters; the upper two recorded conductivity as well as temperature, pressure, speed and direction. The shallowest current meter was intended to be placed at a depth of 25 m, but its pressure sensor showed the actual depth to be 7 m; this indicates the subsurface float was within the zone of significant wave action, and the data from Ohia is therefore subject to the errors associated with mooring motion (Halpern and Pillsbury, 1976). The inner mooring, Sunflower, had four current meters; the top and bottom ones recorded conductivity as well as the more usual parameters. Both Sunflower and Ohia were moored on 27 April 1975 and recovered on 29 July 1975. Sunflower was replaced with three current meters, at 25, 75 and 90 m; it was retrieved on 18 September 1975 (Fig. 6). Hydrographic sections along 45°N were made in mid-May and late July 1975 (Fig. 6).

OBSERVATIONS FROM MOORED  
CURRENT METERS

### Observations from Moored Current Meters

All of the moored current meters were Aanderaa RCM-4 instruments. Current meters were moored on taut wire arrays with subsurface flotation of the type described by Pillsbury, Smith and Tipper (1969). The instruments measure and record the various parameters sequentially; the cycle is repeated at regular intervals (20 min for both WISP and UP-75). The parameters recorded by all instruments are: reference word, rotor count, direction, and temperature; some current meters also measure pressure and/or conductivity. The difference between successive rotor counts is used to calculate the average speed over the interval; this speed is combined with the instantaneous direction to calculate eastward and northward components of the current. The instrument clocks, rotors, compasses and temperature sensors were calibrated as described by Pillsbury *et al.* (1974a). Results of the temperature calibrations before and after WISP are shown in Table I; those for UP-75 are shown in Table II.

### Conductivity Calibration and Processing

The normal conductivity range of Aanderaa RCM-4 current meters is 0 to 60 mmhos  $\text{cm}^{-2}$ . Since this is encoded as a number between 0 and 1023, the conductivity resolution is  $\pm 0.06 \text{ mmhos cm}^{-2}$ . The instruments were modified to reduce the conductivity range to about 30 to 50 mmhos  $\text{cm}^{-2}$  (Mesecar and Barstow, 1975); the resulting resolution is  $\pm 0.02 \text{ mmhos cm}^{-2}$ . All eleven current meters deployed during WISP had modified conductivity sensors; all but one recorded conductivity successfully. Five current meters with modified conductivity sensors were used during UP-75 but the conductivity data from one of these (50 m, Sunflower B) was not processed because temperature was not recorded.

Table I. Temperature calibration of current meters used during WISP, showing the calibration dates and constants ( $T = a + bN + cN^2$ ), and the differences between the two calibrations at three temperatures.

The conductivity sensors were calibrated in the laboratory in September 1974 and September 1975 by immersing the current meters in a well-mixed bath whose salinity was measured with a bench salinometer and whose temperature was measured with a quartz probe. The 1974 calibration points were used to calculate the linear regression equation between the Aanderaa output,  $k$ , and the conductivity calculated from the bath temperature and salinity. The regression constants for the WISP and UP-75 current meters are shown in Table III; the deviations for both 1974 and 1975 calibration points from the regression line are shown in Fig. 7 for each current meter. The difference between the 1974 and 1975 calibrations is usually less than 0.1 in the range of conductivities encountered during WISP (30 to 35 mmhos  $\text{cm}^{-2}$ ; bit numbers less than 250). Since the current meter at 25 m Sunflower was damaged when the array was recovered, no 1975 calibration data are available for it. Another (#689) showed large differences between the 1975 and 1974 calibration data; inspection of the conductivity cell showed a large chip in the glass liner; it is not known whether it was damaged before or after installation at sea.

The purpose of measuring the conductivity is to obtain time series of salinity, which can be calculated from temperature, conductivity and pressure. For pressure,  $P$ , we used either the direct Aanderaa pressure observations or, in their absence, a constant based on our knowledge of the instrument depth. Temperature,  $T$ , was processed using the 1974 calibration constants (Tables I and II). The preliminary conductivity estimate,  $C_p$ , was obtained from the 1974 calibration constants (Table III). We used equations from Perkin and Walker (1972) to estimate the salinity  $S_p = f(P, T, C_p)$ . This preliminary estimate of salinity was compared to the salinity from nearby CTD stations

Table III. Regression constants for the 1974 laboratory calibration of the modified Aanderaa conductivity sensors ( $C = a + bk$ ).

by plotting both as a function of time. Where there was a systematic difference between the two, which could arise because of the pressure effect on the Aanderaa conductivity cell (Huyer, 1975), it was used to adjust the conductivity estimate. Salinity was again determined, and again compared to CTD values. Table IV shows the conductivity equations finally adopted for the instruments which were affected by the in situ pressure.

#### Data Presentation

The 20 min time series of eastward current, northward current, temperature, pressure and salinity are filtered to suppress high frequency signals

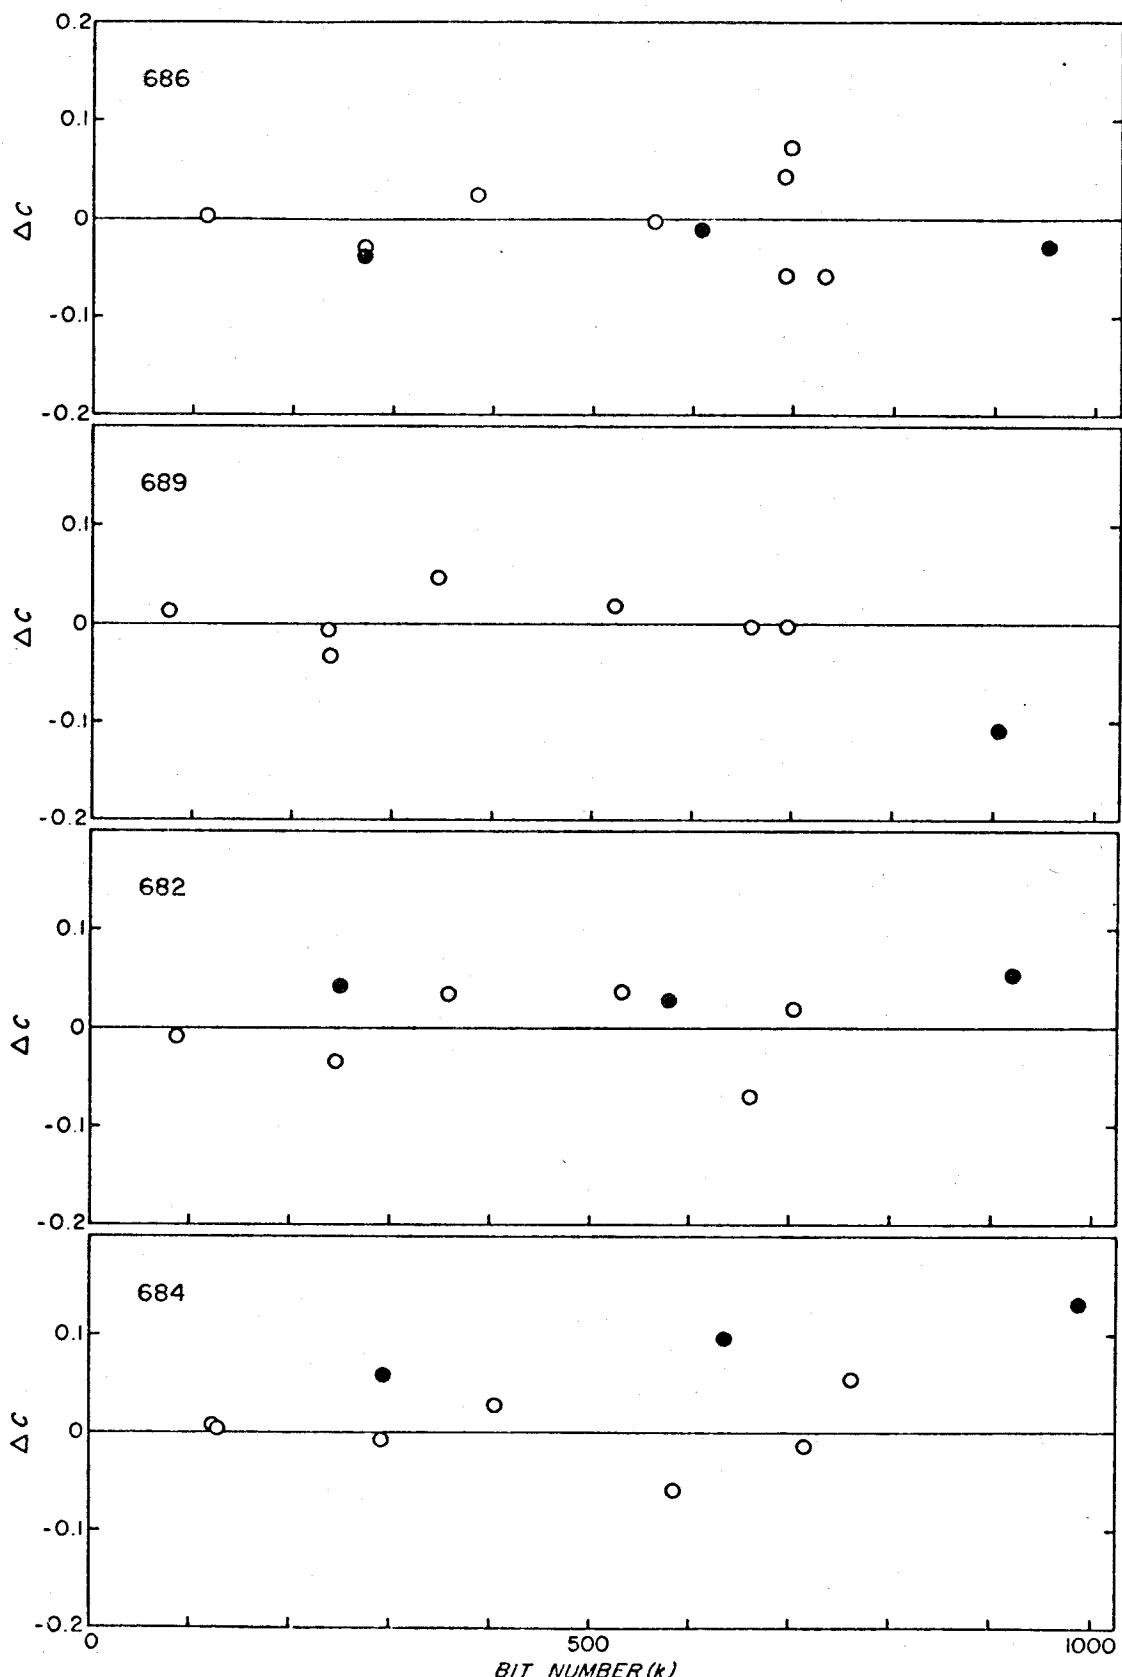

Figure 7. Deviations of the laboratory calibration data points from the regression line based on the 1974 points.  $\Delta C$  is the difference between the conductivity computed from temperature and salinity of the bath and the conductivity from the Aanderaa output  $C = a + bk$  ( $a$  and  $b$  are the constants in Table III). Open circles are the 1974 data points; dots are 1975 data points.

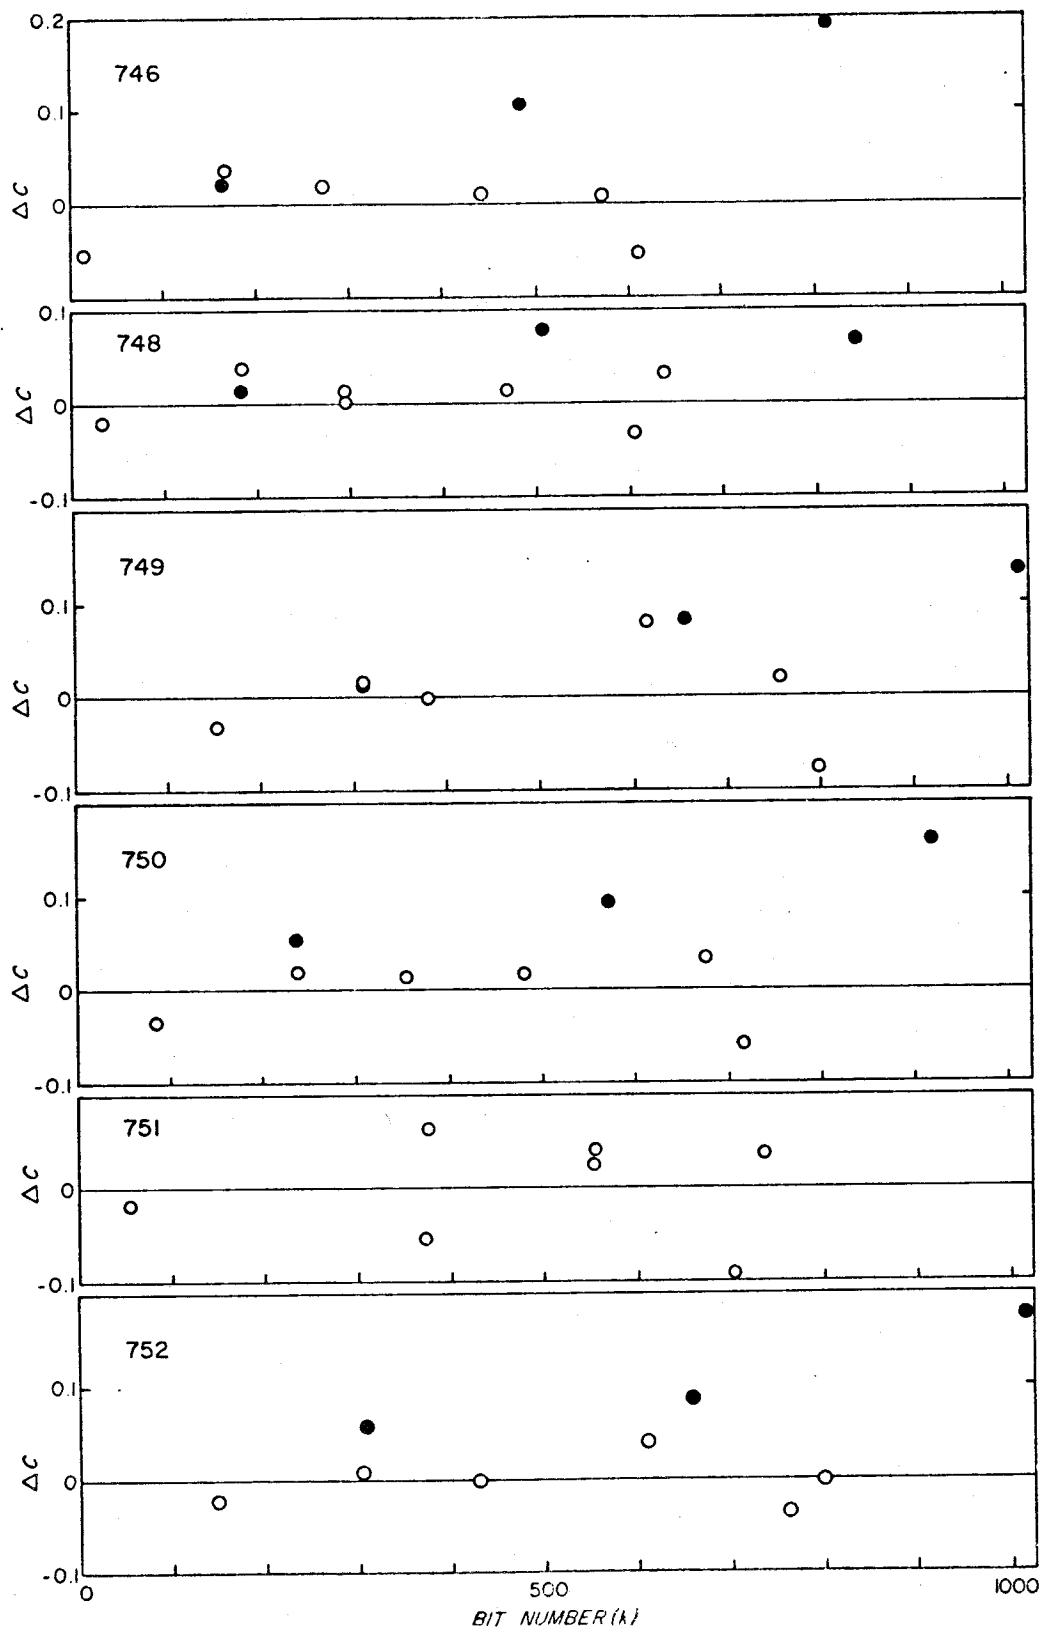

Figure 7. Cont'd.

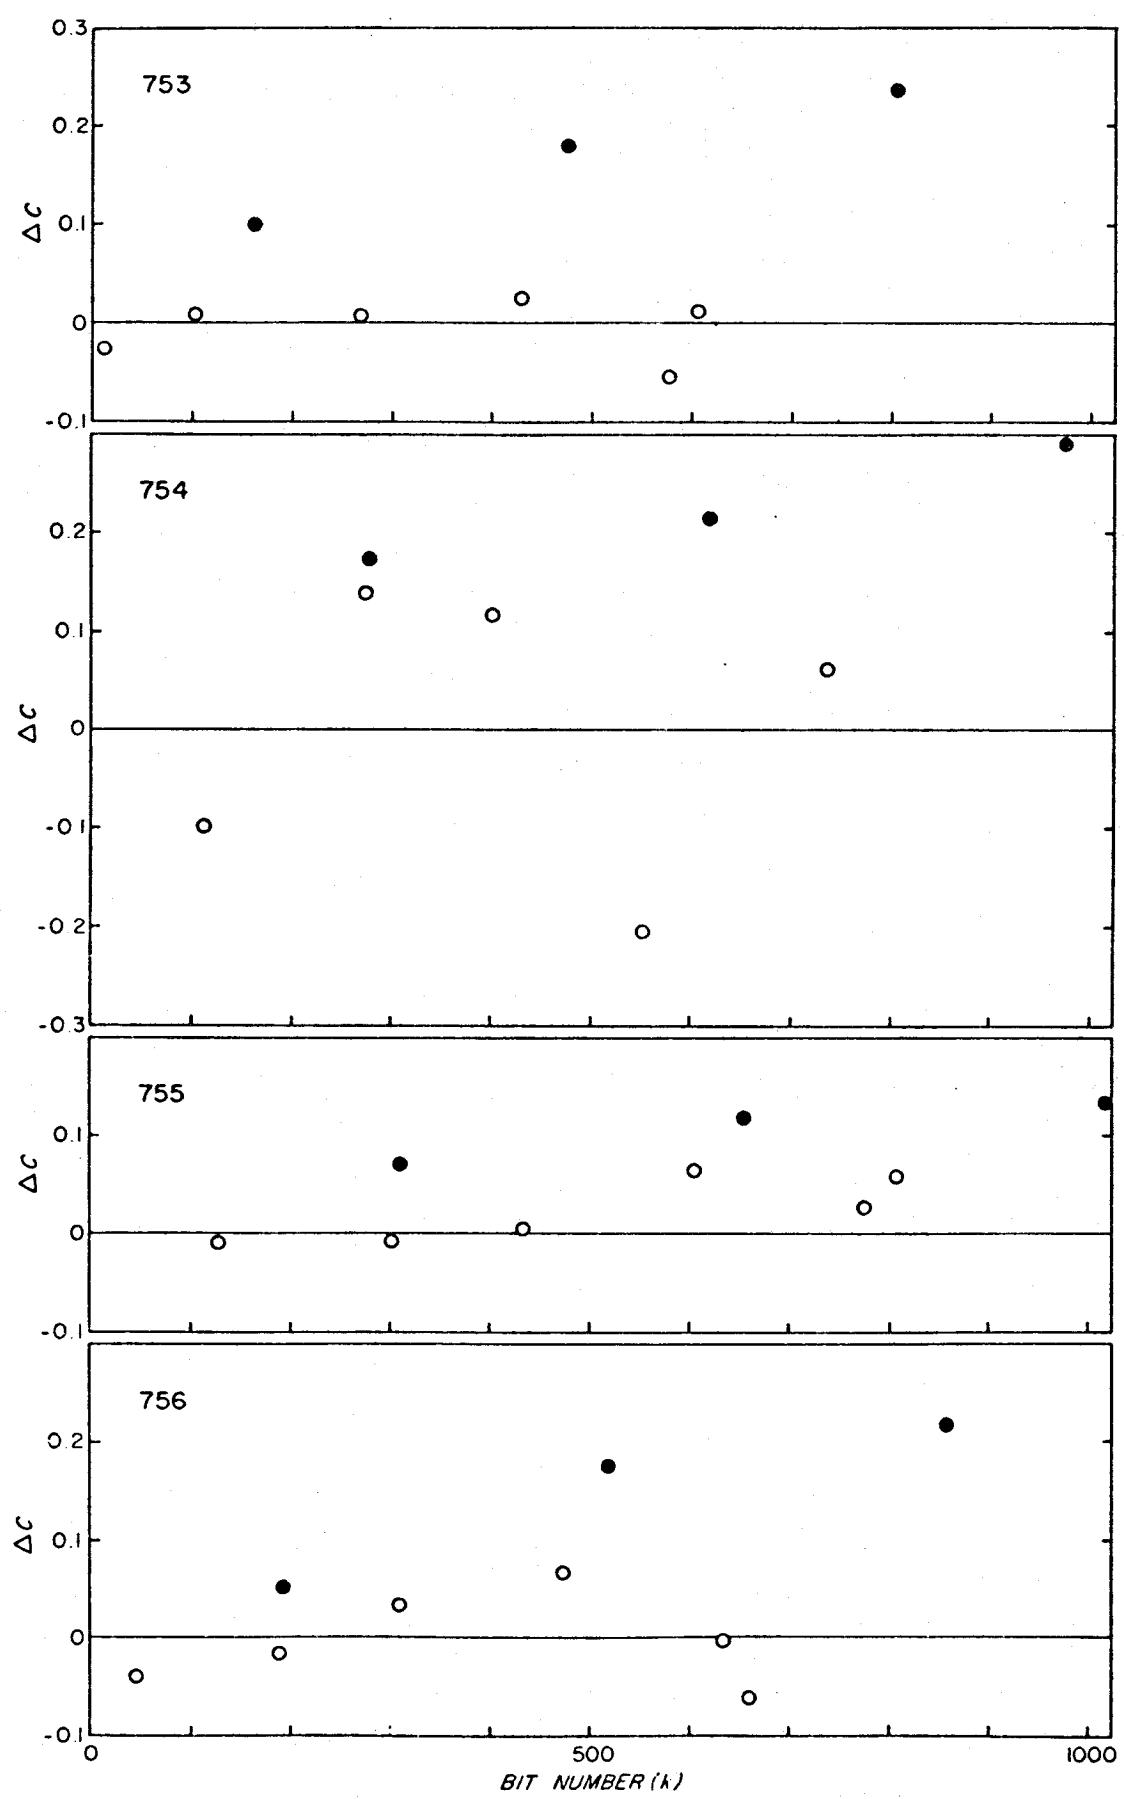

Table IV. Conductivity calibration constants ( $C = a_1 + bk = a_0 + a + bk$ ) for calculating the conductivity from Aanderaa bit number ( $k$ ) for current meters whose calibration was affected by the in situ pressure. Constants  $a$  and  $b$  were determined from the laboratory calibration and are given in Table III;  $a_0$  is the correction for the pressure effect on the sensor.

(e.g., internal waves), yielding hourly values. It is these hourly values that are presented in this report. The data from each string of current meters are presented separately. The header page gives the pertinent information about the location of the string, the data interval, and a general statement about the quality of the data. The depth of the instruments is given two ways: intended depth, and actual depth which is based on the mean pressure as measured by the pressure sensor or on information about the total water depth and wire lengths. First order statistics of each parameter are tabulated. A progressive vector diagram is presented for each current record. The hourly time series of sigma-t are computed from the time series of temperature and salinity, and the hourly time series of each parameter are displayed. Values of temperature, salinity and sigma-t from nearby CTD stations are displayed with the time series of these parameters (dots are from CTD stations included in this report; triangles are from stations occupied by the THOMAS G. THOMPSON; personal communication, B. Hickey).

90 m	92 m	754/14

The 25 m instrument caught in screws and flooded at start of recovery. Data were recorded every 20 minutes. All meters recorded current speed and direction, temperature, pressure and conductivity data.

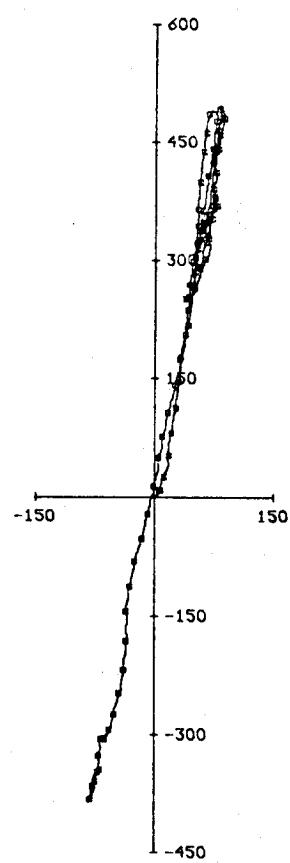

The fouling of the current meter disabled the CAYUSE, and it was towed into Newport by the R/V YAQUINA. Participants were presented commemorative certificates (see facing page).

Position: 44°59.3'N, 124°43.8'W

Depth of Water: 543 m

Set at 1815 GMT 26 April 1975 by R/V CAYUSE

Retrieved at 1324 GMT 29 July 1975 by R/V YAQUINA

Data Interval: 2207 GMT 26 April to 1547 29 July

Instrumentation

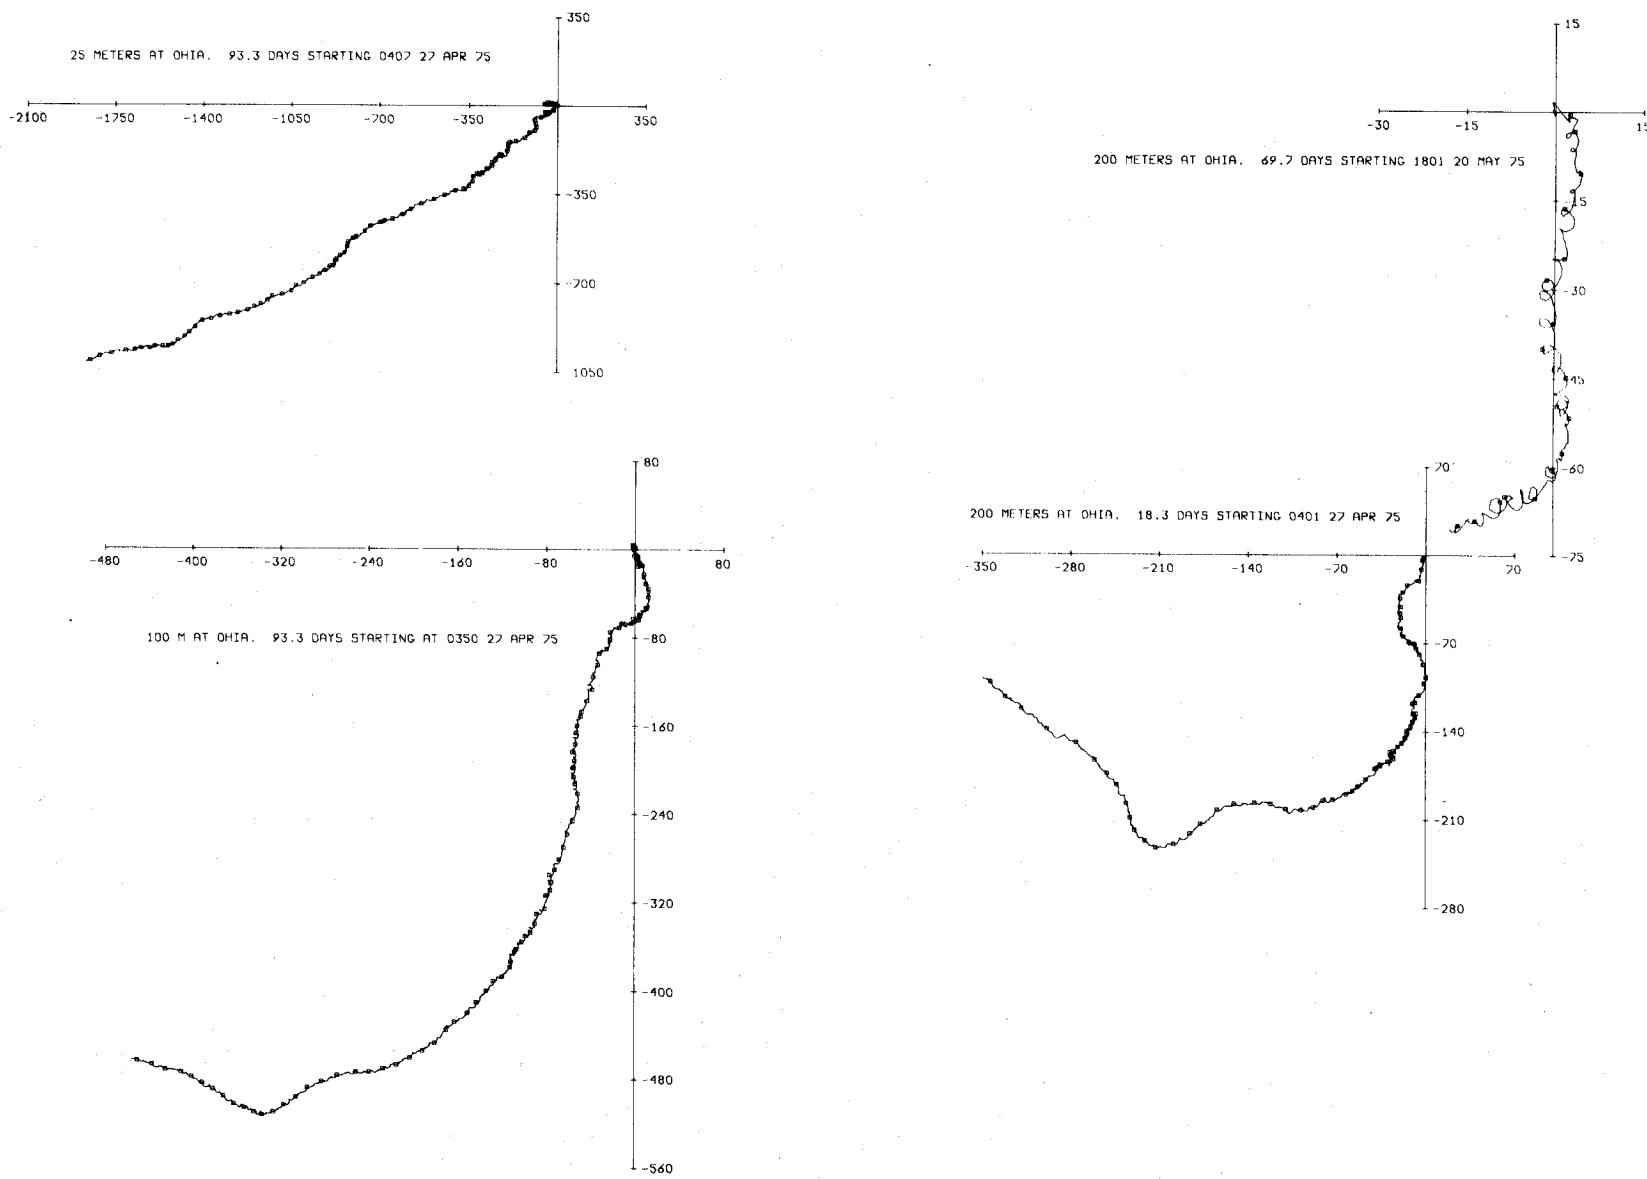

<u>Intended Depth</u>	<u>Actual Depth</u>	<u>RCM4 Serial No./Tape No.</u>
25 m	7 m	686/24
100 m	82 m	689/17
200 m	182 m	1530/4
300 m	282 m*	1532/4
400 m	382 m*	1533/4
500 m	482 m*	1537/4

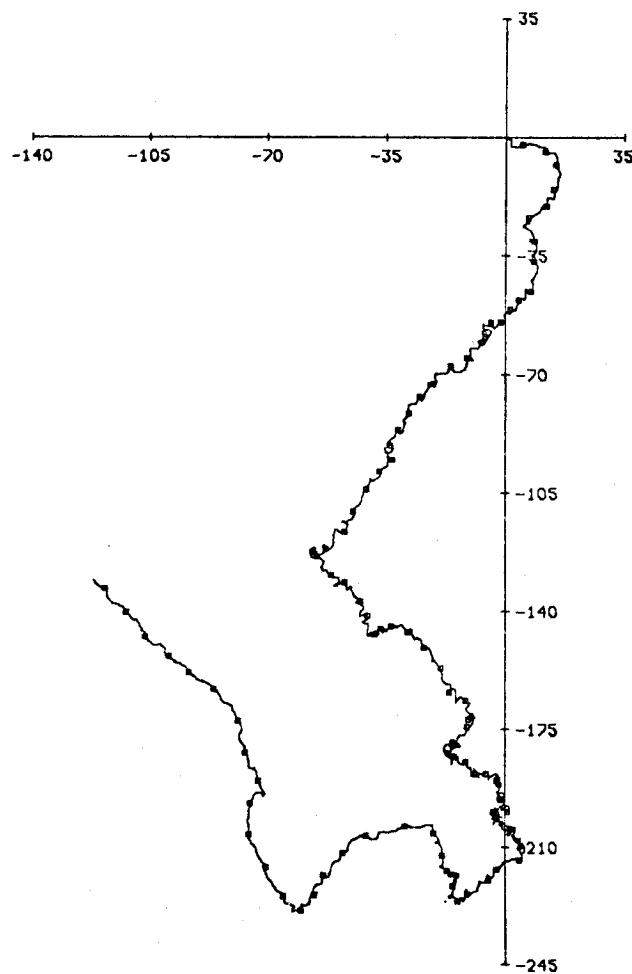

Data were recorded every 20 minutes. Two top meters recorded current speed and direction, temperature, pressure and conductivity. Bottom four meters recorded current speed and direction, and temperature. At the top current meter, conductivity data was below the minimum of the instrument for several hours on 25 May 1975. The 200 m meter's speed sensor failed at 1800 GMT 15 May and recovered at 1200 GMT 20 May. In processed data file, speed, u, and v have been zeroed from line 905 to 1132 inclusive. These lines weren't used in computing speed, u, and v statistics.

\* The pressure records show that the upper two current meters, whose nominal depths were 25 m and 100 m, actually set at 7 m and 82 m. This may indicate (a) that the water depth at the mooring was 18 m shallower than estimated, in which case all six of the current meters were 18 m shallower than their nominal depths, or (b) that one or more of the cable lengths below the 100 m instrument were too long. We believe the former is more likely.

<u>Intended Depth</u>	<u>Actual Depth</u>	<u>RCM4 Serial No./Tape No.</u>
25 m	27 m	682/26
50 m	52 m	268/34
75 m	78 m	1539/4
90 m	93 m	684/23

Data were recorded every 20 minutes. All meters recorded current speed and direction. In addition, 27 and 93 m meters recorded temperature, pressure and conductivity, 52 m recorded conductivity, and 78 m recorded temperature.

Meter 268 had a 1200:1 speed reduction ratio during this installation, and as a result speed required special processing. At speeds above about 45 cm/sec the wiper of the speed potentiometer made more than a complete circuit during each cycle. Even at lower speeds a large fraction of the speed readings involved crossing the potentiometer's dead zone, whose width is unknown. The record was processed assuming a 9-bit dead zone. There was no interpolation at dead zone crossings, since they constituted such a large part of the record. The resulting speed record was jumpier than usual, probably because the width of the dead zone is not 9 bits. The roughness was then removed with a single hanning. As a result, there may be appreciable error in the immediate vicinity of sharp changes of speed.

LOW PASSED TIME SERIES OF WIND,  
ADJUSTED SEA LEVEL AND OBSERVATIONS  
FROM MOORED CURRENT METERS

Low Passed Time Series of Wind, Adjusted Sea Level  
and Observations from Moored Current Meters

The hourly observations from the current meters were filtered to suppress signals with diurnal and shorter periods. The filter is symmetrical, has 61 unique weights and a half power point at about 40 hours. The filter has been used extensively in earlier observations off Oregon (e.g., Mooers *et al.*, 1968; Smith, 1974). At the beginning and end of the time series, the number of filter weights is reduced so that only 24 hours (instead of 60) are lost at each end.

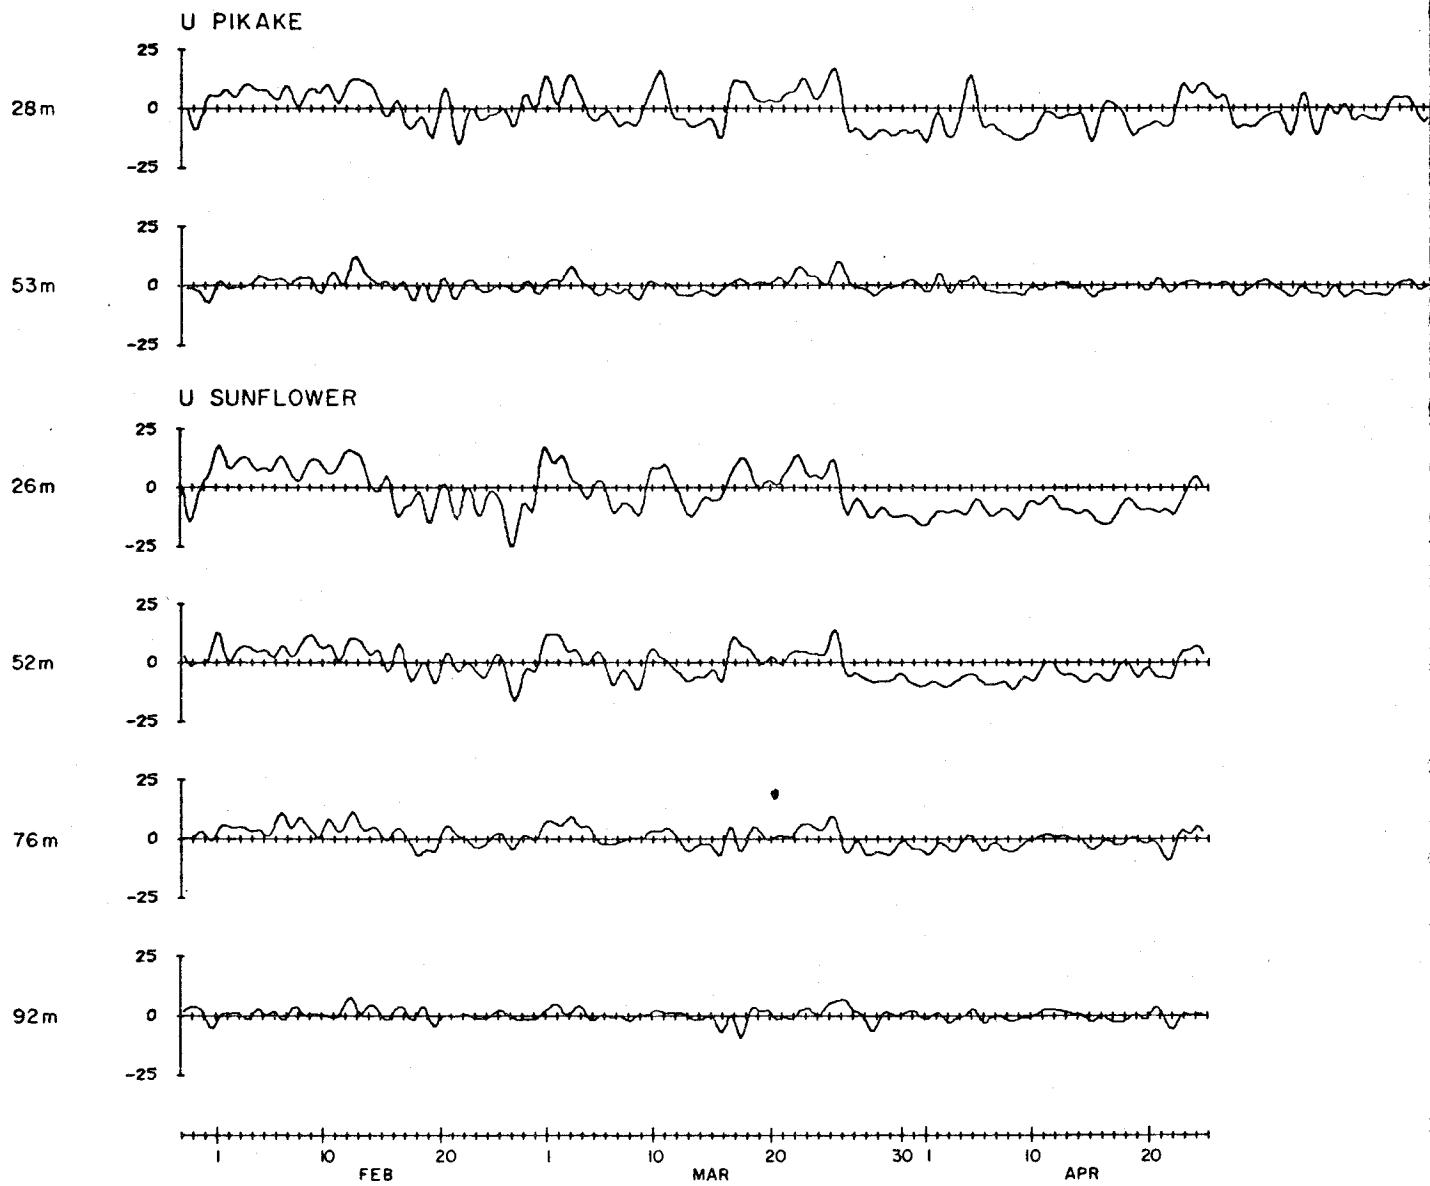

As well as the observations from the current meters, we include in this section observations of the Newport wind and sea level, since both have previously been shown to be related to the oceanography of the shelf water (e.g., Smith, 1974). Hourly observations are made of the wind, sea level and atmospheric pressure. Wind stress is calculated from the hourly wind velocity components:

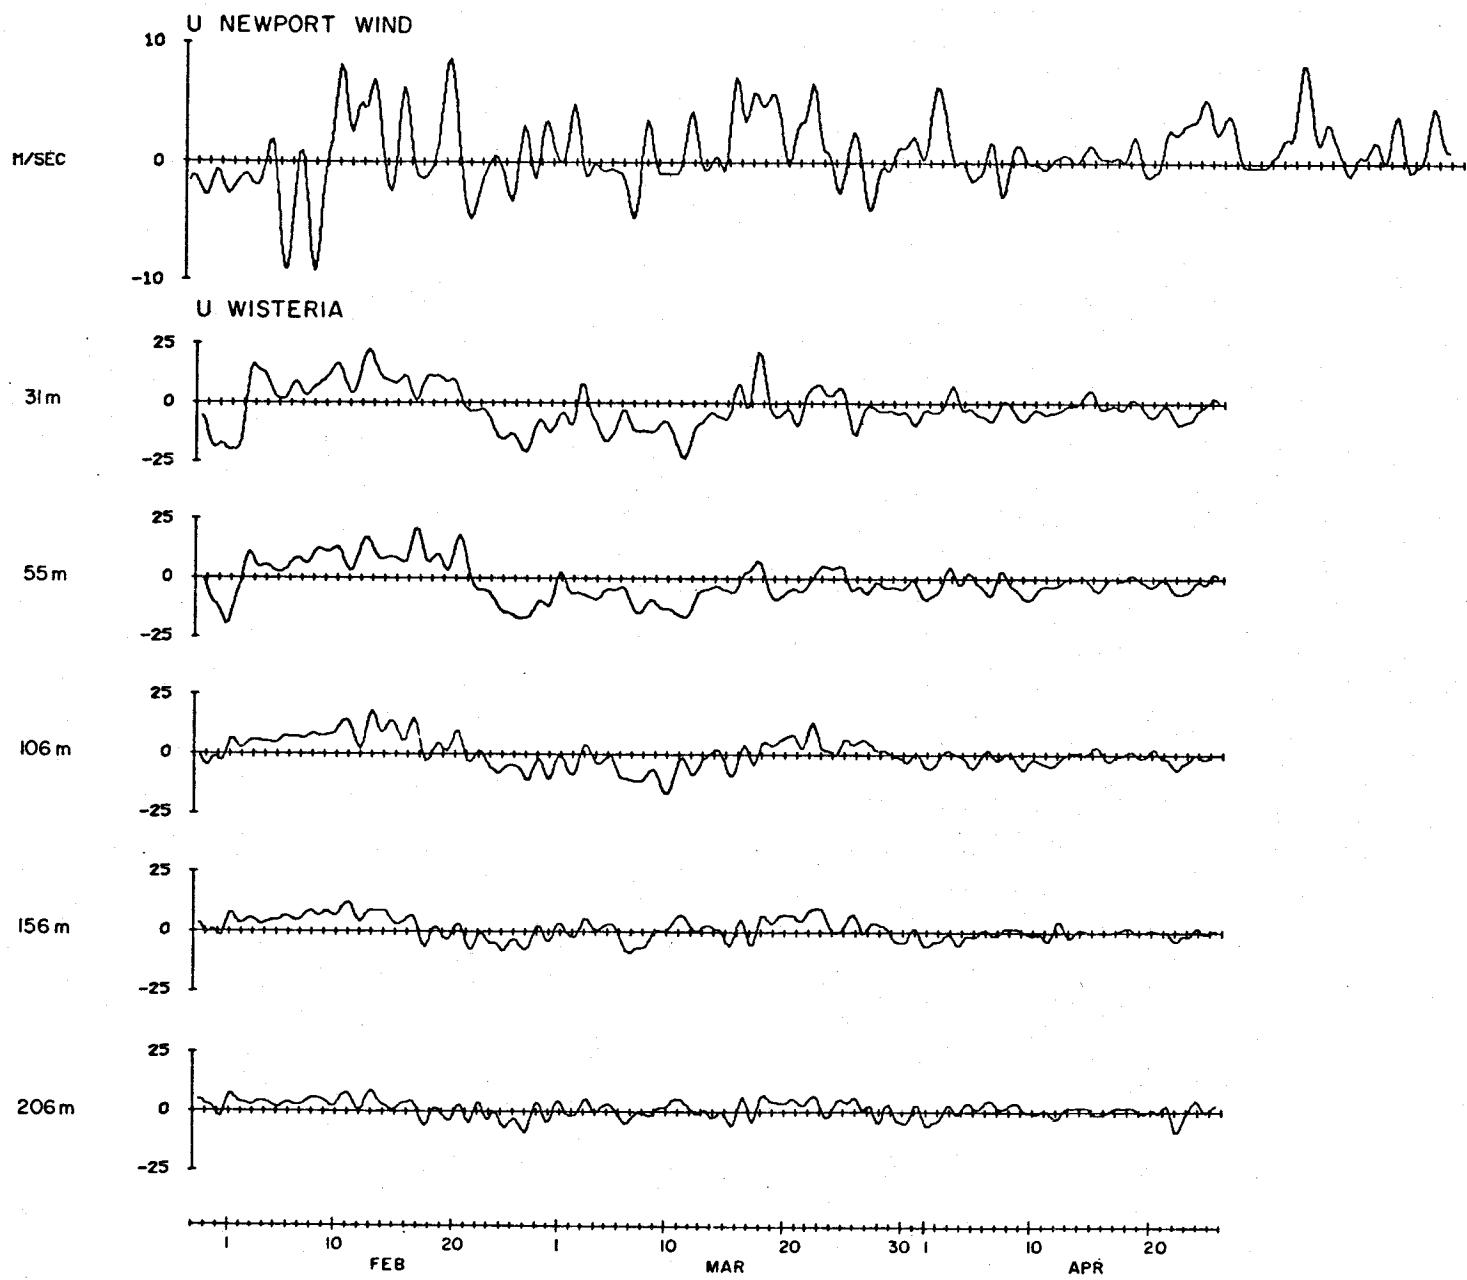

$$\begin{aligned}\tau_x &= 1.25 \times 10^{-3} \times 1.5 \times 10^{-3} (u^2 + v^2)^{\frac{1}{2}} u \\ \tau_y &= 1.25 \times 10^{-3} \times 1.5 \times 10^{-3} (u^2 + v^2)^{\frac{1}{2}} v.\end{aligned}$$

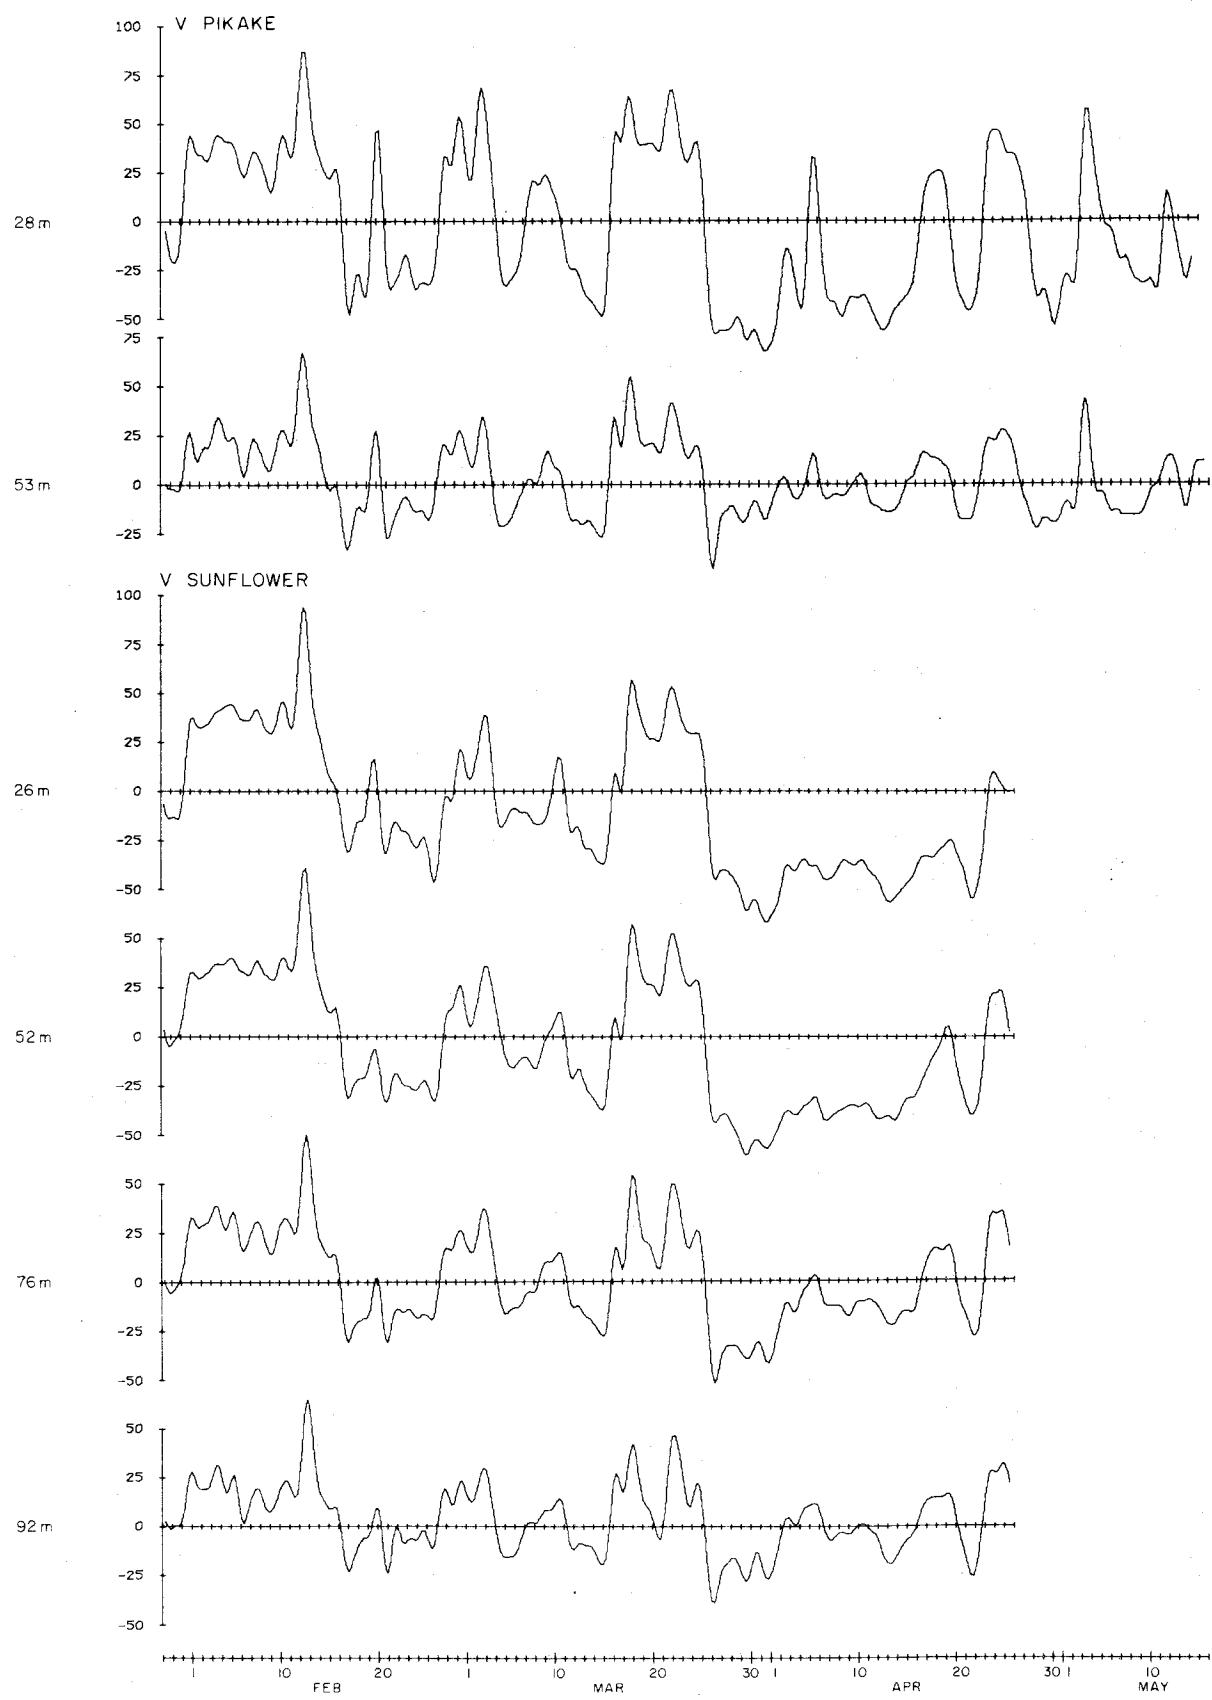

Sea level is adjusted for the inverted barometer effect by adding 1 cm for every 1 mb change in atmospheric pressure. The hourly values of wind velocity, wind stress, and adjusted sea level were low passed in the same way as parameters from the current meters.

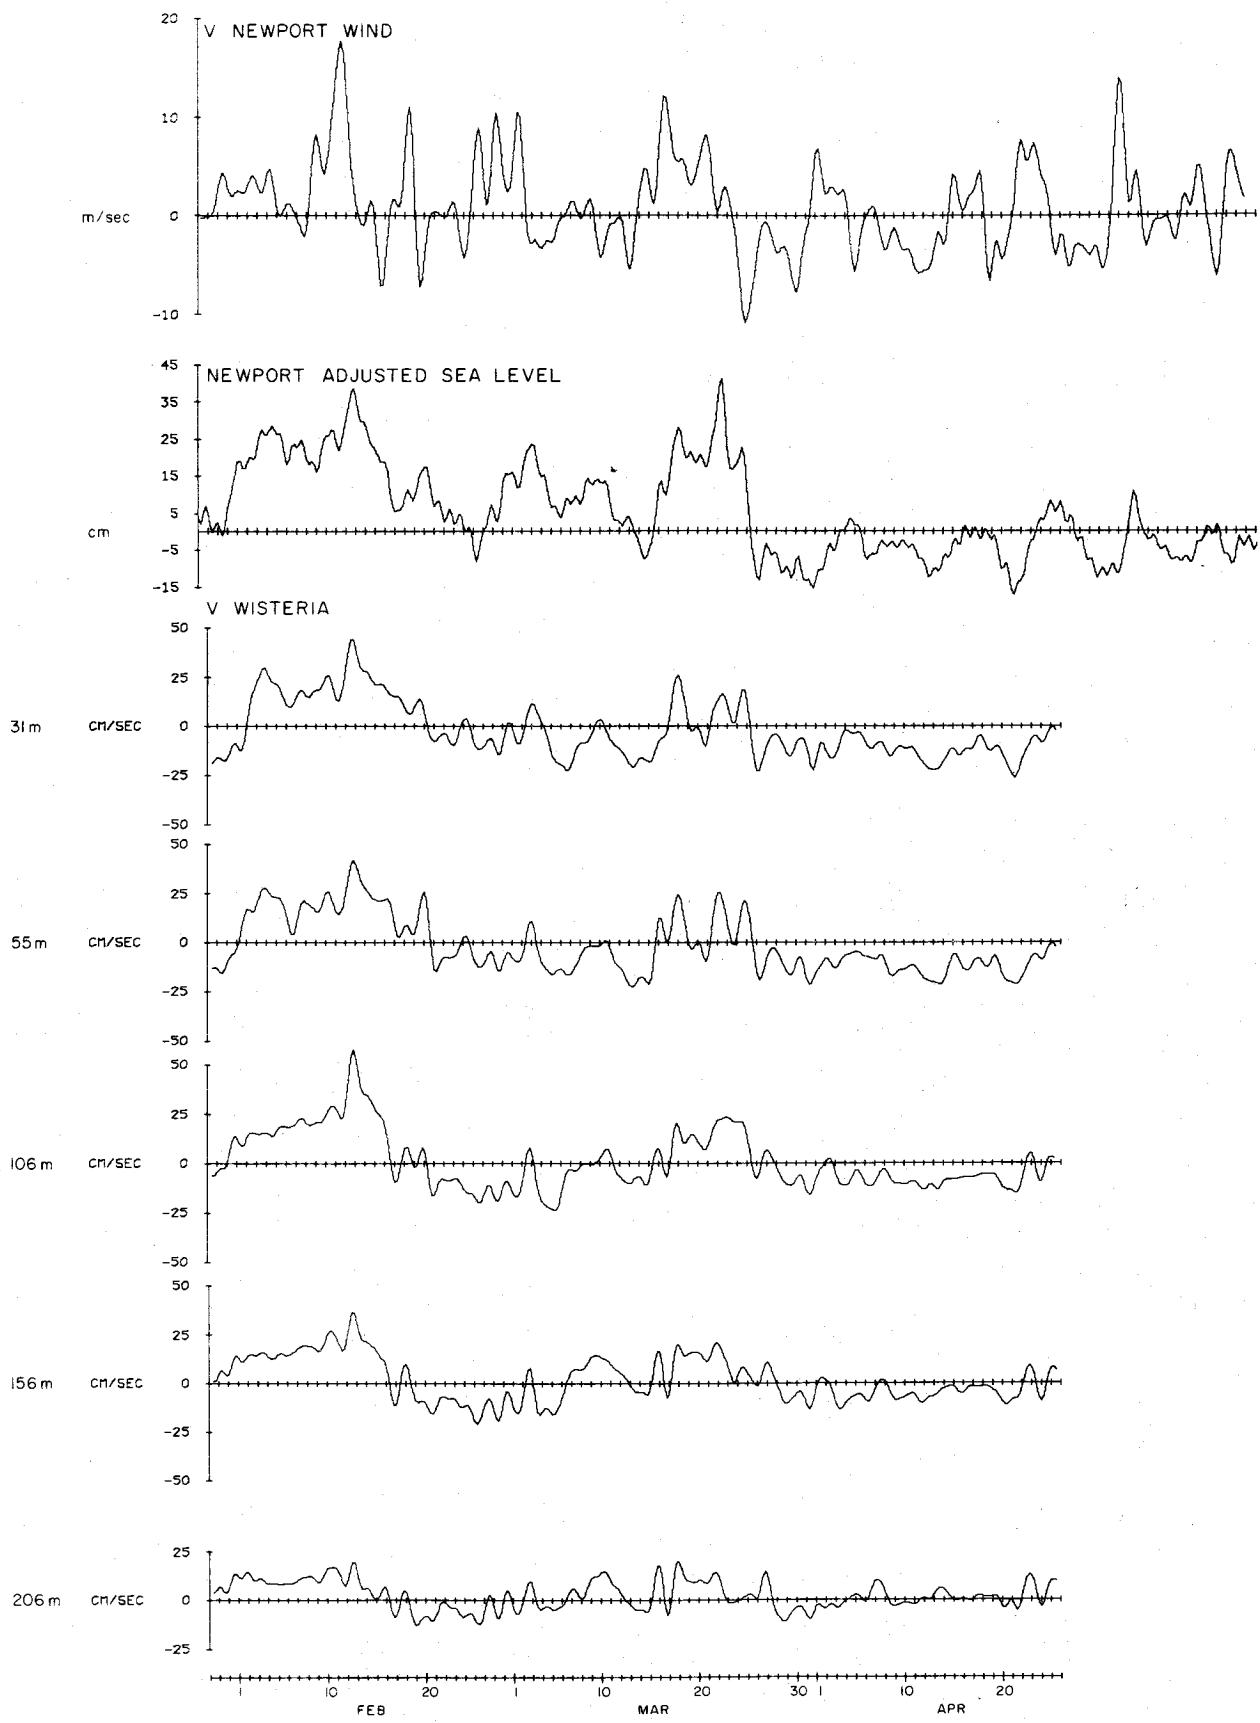

Simultaneous observations of the same parameter from the different moorings are put on the same or facing pages. The eastward component of the wind is shown with the eastward component of the currents. The northward component of the wind and the adjusted sea level are shown with the northward components of the currents. Time series of the current vectors (stick diagrams) are shown with time series of the vector wind stress.

## CTD OBSERVATIONS

### CTD Observations

Hydrographic stations along 45°N were occupied on eight cruises of the R/V YAQUINA between January and July 1975. Stations were usually at intervals of six minutes of longitude over the shelf and upper slope, and at 12' to about 125°W.

Each station consisted of a single cast of a Geodyne conductivity-temperature-depth (CTD) probe, with one sampling bottle equipped with reversing thermometers mounted about 2 m above the CTD sensors. The CTD normally records while it is being lowered at a rate of 15-30 m min<sup>-1</sup>. The sample bottle is usually tripped at the bottom of the cast, after a 5-10 minute wait to allow the thermometers to reach equilibrium. The sample is collected to provide in situ calibrations of the CTD probe.

A total of four different CTD probes were used. Each measures pressure, temperature and conductivity sequentially. Each probe begins the sampling cycle at regular intervals of 4 sec or less. Each probe must be calibrated separately; whenever a sensor is replaced or repaired, it must be recalibrated.

The CTD data usually undergoes preliminary processing at sea on a PDP-8 computer. For processing the temperature data at sea we use an equation of the form:

$$T_p = c + bN_T + aN_T^2$$

where  $N_T$  is the CTD bit number,  $T_p$  is the preliminary temperature estimate, and a, b, and c are determined by a least squares fit to the laboratory calibration data. For conductivity we use a preliminary equation of the form:

$$C_p = kN_C$$

where  $C_p$  is the preliminary conductivity estimate and  $N_c$  is the CTD bit number for conductivity, and  $k$  is the same for all probes, regardless of their current status. For pressure, we use equations of the form:

$$P = c + bN_p + aN_p^2$$

where  $N_p$  is the CTD bit number, and  $a$ ,  $b$ , and  $c$  are provided by the sensor manufacturer.

#### Temperature Calibration

The CTD temperature sensors are calibrated by using two or three protected reversing thermometers on the sample bottle above the probe. The reversing thermometers are calibrated once per year against a quartz probe, and have an accuracy of  $\pm 0.02^\circ\text{C}$ .

The sample temperature,  $T_s$ , is compared to the preliminary CTD temperature,  $T_p$ , and linear and quadratic relationships are determined by a least squares fit:

$$T_s = a_1 + b_1 T_p + c_1 T_p^2$$

In practice,  $c_1$  is negligible,  $b_1$  is usually equal to 1, and the procedure is really used to determine  $a_1$ . This amounts to changing the temperature equation to:

$$T = (c + a_1) + bN_T + aN_T^2$$

The temperature calibration constants determined for each cruise are shown in Table V.

#### Conductivity Calibration

A water sample is collected from the sample bottle and its salinity is determined on a bench salinometer with a precision of better than 0.005 o/oo.

Table V . Final temperature calibration constants used to compute CTD  
temperatures  $T = a + bN_T + cN_T^2$ , for each probe, 1975 cruises.

Conductivity of the sample,  $C_s$ , is calculated from the sample temperature and salinity, by an iteration method and Perkin and Walker's (1972) equations:

$$C_s = f(P, T_s, S_s).$$

The sample conductivity is compared to the preliminary CTD conductivity  $C_p$ . We assume a relationship:

$$C_s = b_0 C_p$$

and determine  $b_0$  by minimizing the sum of squared differences. This amounts to determining a new value of  $k$ , so that

$$C = k_1 N_c = b_0 k N_c.$$

Table VI shows values of  $b_0$  for each probe on all cruises.

#### Data Processing

After the calibration constants have been determined for a particular cruise, the CTD data are read from magnetic or punched paper tapes. Pressure, conductivity and temperature are calculated. If depth remains constant, conductivity and temperature from up to six samples are averaged. If pressure decreases, the data are deleted. The resulting pressure-increasing file is used to calculate salinity using Perkin and Walker's (1972) equations, and sigma-t is calculated using Knudsen's equation as reported by Sweers (1971). Profiles of  $T$ ,  $S$ ,  $\sigma_t$  are plotted for error detection. The data are edited by hand to remove obviously erroneous values.

The final processed values of temperature and salinity are again compared to the sample values. Results are summarized in Table VII.

Table VI. Conductivity calibration constants,  $b_o$ , for the CTD probes, 1975 cruises, and the number of stations, N, from which the constants are calculated.

\* Note - Stations from Probe No. 4, Y7510A were split into two groups, A and B, because the difference population was strongly bimodal.

Data Presentation

The hydrographic data is summarized in vertical sections of temperature, salinity and sigma-t. The distributions were contoured by hand. Tick marks at the top of each section indicate station positions at which a CTD cast was made.

Following the vertical distributions, the hydrographic data are presented in more detail. Data from each cruise are presented separately, beginning with a map of station positions. For each station, profiles of temperature, salinity and sigma-t are shown. The header data for each station gives location and weather information coded as follows:

CAST NO	Consecutive cast number. For CTD casts, the number is followed by "U" if the profile was obtained during ascent of the probe or "D" if it was obtained during descent.
STATION	Station designator for positions along the L or H lines, or indicating parachute drogue stations (D).
LAT	Latitude in degrees and minutes north of the equator.
LONG	Longitude in degrees and minutes west of Greenwich.
DATE	Month/day/year.
TIME	Hours and minutes, Universal time.
DPTH	Bottom depth in meters.
PROBE	OSU1, OSU2, OSU3 - CTD units 1, 2, 3. STD - Bissett Berman self-contained probe unit.
SWELL DIR	Direction in degrees True from which the swell propagates.
HT	Swell height in feet.
PER	Swell period in seconds.
BAR	Atmospheric pressure in excess of 1000 mb.
WEATHER	See WMO weather code.
WIND DIR	Direction in degrees True from which the wind blows.

SPD Wind speed in knots.

CLOUD TYPE The two predominant cloud types (see WMO Cloud Type code).

AMOUNT Coded cloud amount (see WMO Cloud Amount code).

AIR TEMP Air temperature in degrees Celsius.

WET BULB Wet bulb temperature in degrees Celsius.

The data listing includes observed and calculated parameters at the shallowest and deepest observation levels. If there was no observation at 0 m, sea surface values are assumed to be the same as those of the shallowest observation. For each depth, the temperature (TEMP) and salinity (SAL) values are as observed or interpolated linearly from the nearest neighboring values. Sigma-t (SIGMA), specific volume anomaly  $\times 10^5$  (SVA), dynamic height (DELD) in dynamic meters, and potential energy in  $10^8$  ergs  $\text{cm}^{-2}$  (POTE) are given for each depth. Computed parameters are calculated from the complete data array.

#### WMO WEATHER CODE

##### CLOUD TYPE CODE

Code	Cloud Type	Code	Cloud Type
0	Cirrus .....	Cl	Nimbostratus .....
1	Cirrocumulus .....	Cc	Stratocumulus .....
2	Cirrostratus .....	Cs	Stratus .....
3	Altocumulus .....	Ac	Cumulus .....
4	Altostratus .....	As	Cumulonimbus .....
X	Cloud not visible owing to darkness, fog, duststorm, sandstorm, or other analogous phenomena		

##### CLOUD AMOUNT CODE

Code	Cloud Cover	Code	Cloud Cover
0	0	6	6 oktas
1	1 okta or less, but not zero	7	7 oktas or more, but not 8 oktas
2	2 oktas	8	8 oktas
3	3 oktas	9	Sky obscured, or cloud amount cannot be estimated
4	4 oktas		
5	5 oktas		

Note: 1 okta =  $\frac{1}{8}$  of the sky covered

## WMO WEATHER CODE

## NO PRECIPITATION ON STATION AT TIME OF OBSERVATION

Code figure			
No meteors except photometors	ww		
00	Cloud development not observed or not observable		
01	Clouds generally dissolving or becoming less developed		
02	State of sky on the whole unchanged		
03	Clouds generally forming or developing		
04	Visibility reduced by smoke, e.g. veldt or forest fires, industrial smoke or volcanic ashes		
05	Haze		
06	Widespread dust in suspension in the air, not raised by wind at or near the station at the time of observation		
07	Dust or sand raised by wind at or near the station at the time of observation, but no well developed dust whirl(s) or sand whirl(s), and no duststorm or sandstorm seen		
08	Well developed dust whirl(s) or sand whirl(s) seen at or near the station during the preceding hour or at the time of observation, but no duststorm or sandstorm		
09	Duststorm or sandstorm within sight at the time of observation, or at the station during the preceding hour		
10	Mist		
11	Patches of shallow fog or ice fog at the station, whether on land or sea, not continuous		
12	More or less continuous deeper than about 2 metres on land or 10 metres at sea		
13	Lightning visible, no thunder heard		
14	Precipitation within sight, not reaching the ground or the surface of the sea		
15	Precipitation within sight, reaching the ground or the surface of the sea, but distant (i.e. estimated to be more than 5 km) from the station		
16	Precipitation within sight, reaching the ground or the surface of the sea, near to, but not at the station		
17	Thunderstorm, but no precipitation at the time of observation		
18	Squalls at or within sight of the station during the preceding hour		
19	Funnel clouds or at the time of observation		
		characteristic change of the state of sky during the past hour	
			ww = 20 - 29
			Precipitation, fog, ice fog or thunderstorm at the station during the preceding hour but not at the time of observation
	20	Drizzle (not freezing) or snow grains	
	21	Rain (not freezing)	
	22	Snow	
	23	Rain and snow or ice pellets, type (a)	
	24	Freezing drizzle or freezing rain	
	25	Shower(s) of rain	
	26	Shower(s) of snow, or of rain and snow	
	27	Shower(s) of hail, or of rain and hail	
	28	Fog or ice fog	
	29	Thunderstorm (with or without precipitation)	
	ww = 30 - 39	Duststorm, sandstorm, drifting or blowing snow	
Haze, dust, sand or smoke			
	30	Slight or moderate dust-storm or sand-storm	- has decreased during the preceding hour
	31		- no appreciable change during the preceding hour
	32		- has begun or has increased during the preceding hour
	33	Severe dust-storm or sand-storm	- has decreased during the preceding hour
	34		- no appreciable change during the preceding hour
	35		- has begun or has increased during the preceding hour
	36	Slight or moderate blowing snow	generally low (below eye level)
	37	Heavy drifting snow	
	38	Slight or moderate blowing snow	generally high (above eye level)
	39	Heavy blowing snow	
	ww = 40 - 49	Fog or ice fog at the time of observation	
	40	Fog or ice fog at a distance at the time of observation, but not at the station during the preceding hour, the fog or ice fog extending to a level above that of the observer	
	41	Fog or ice fog in patches	
	42	Fog or ice fog, sky visible	has become thinner during the preceding hour
	43	Fog or ice fog, sky invisible	
	44	Fog or ice fog, sky visible	no appreciable change
	45	Fog or ice fog, sky invisible	during the preceding hour
	46	Fog or ice fog, sky visible	has begun or has become thicker during the preceding hour
	47	Fog or ice fog, sky invisible	
	48	Fog, depositing rime, sky visible	
	49	Fog, depositing rime, sky invisible	

## PRECIPITATION ON STATION AT TIME OF OBSERVATION

ww = 50 - 59 Drizzle

- |    |  |                                 |
|----|--|---------------------------------|
| 50 | Drizzle, not freezing, intermittent          | { slight at time of observation |
| 51 | Drizzle, not freezing, continuous            |                                 |
| 52 | Drizzle, not freezing, intermittent          | { moderate at time of ob-       |
| 53 | Drizzle, not freezing, continuous            | { servation                     |
| 54 | Drizzle, not freezing, intermittent          | { heavy (dense) at time of      |
| 55 | Drizzle, not freezing, continuous            | { observation                   |
| 56 | Drizzle, freezing, slight                    |                                 |
| 57 | Drizzle, freezing, moderate or heavy (dense) |                                 |
| 58 | Drizzle and rain, slight                     |                                 |
| 59 | Drizzle and rain, moderate or heavy          |                                 |

ww = 60 - 69 Rain

- |    |   |                              |
|----|---|------------------------------|
| 60 | Rain, not freezing, intermittent            | { slight at time of observa- |
| 61 | Rain, not freezing, continuous              | { tion                       |
| 62 | Rain, not freezing, intermittent            | { moderate at time of ob-    |
| 63 | Rain, not freezing, continuous              | { servation                  |
| 64 | Rain, not freezing, intermittent            | { heavy at time of observa-  |
| 65 | Rain, not freezing, continuous              | { tion                       |
| 66 | Rain, freezing, slight                      |                              |
| 67 | Rain, freezing, moderate or heavy           |                              |
| 68 | Rain or drizzle and snow, slight            |                              |
| 69 | Rain or drizzle and snow, moderate or heavy |                              |

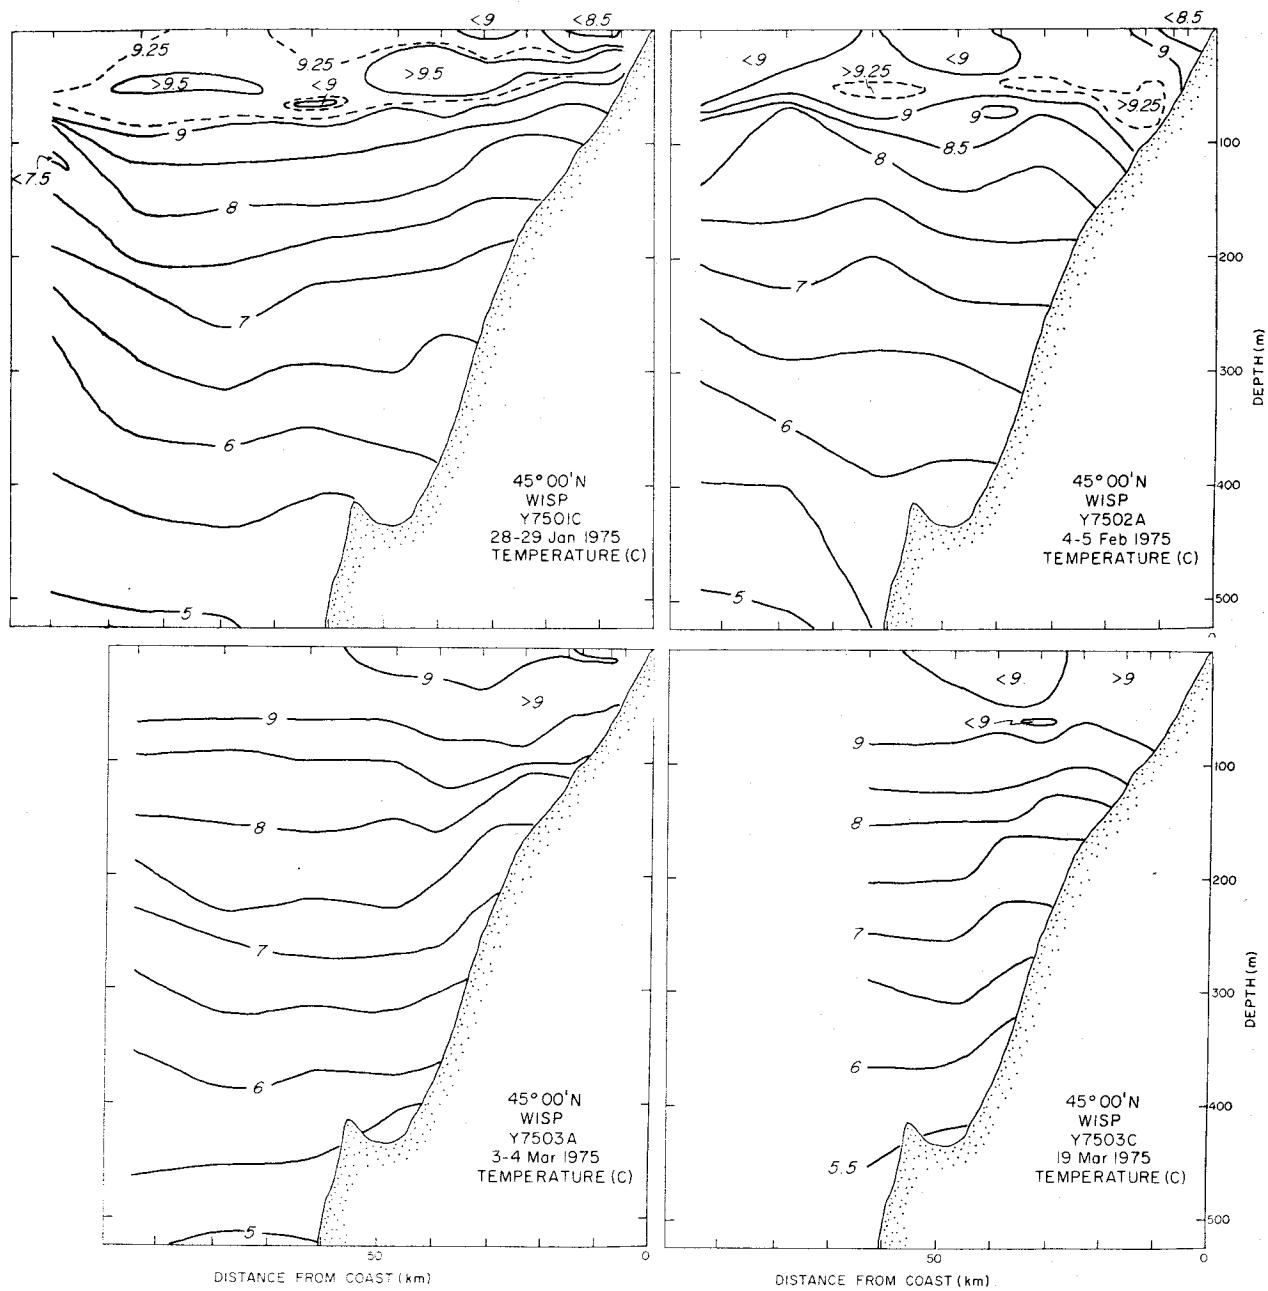

70 - 79 Solid precipitation not in showers

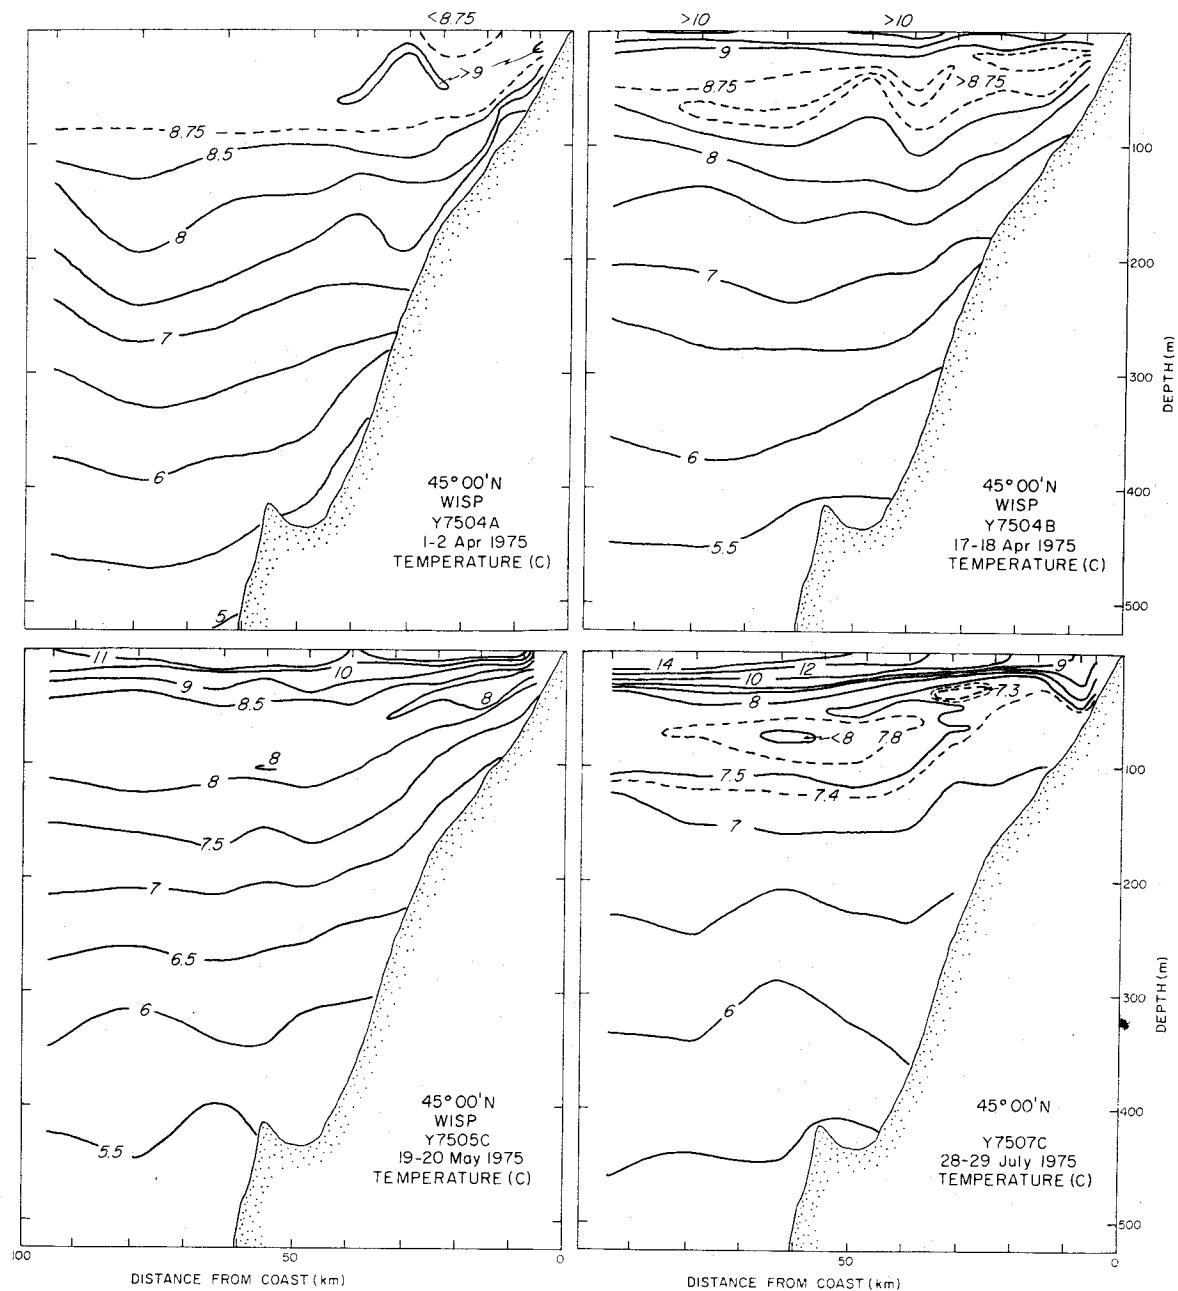

- |    |   |                           |
|----|---|---------------------------|
| 70 | Intermittent fall of snow flakes                      | { slight at time of ob-   |
| 71 | Continuous fall of snow flakes                        | { servation               |
| 72 | Intermittent fall of snow flakes                      | { moderate at time of ob- |
| 73 | Continuous fall of snow flakes                        | { servation               |
| 74 | Intermittent fall of snow flakes                      | { heavy at time of ob-    |
| 75 | Continuous fall of snow flakes                        | { servation               |
| 76 | Ice prisms (with or without fog)                      |                           |
| 77 | Snow grains (with or without fog)                     |                           |
| 78 | Isolated starlike snow crystals (with or without fog) |                           |
| 79 | Ice pellets, type (a)                                 |                           |

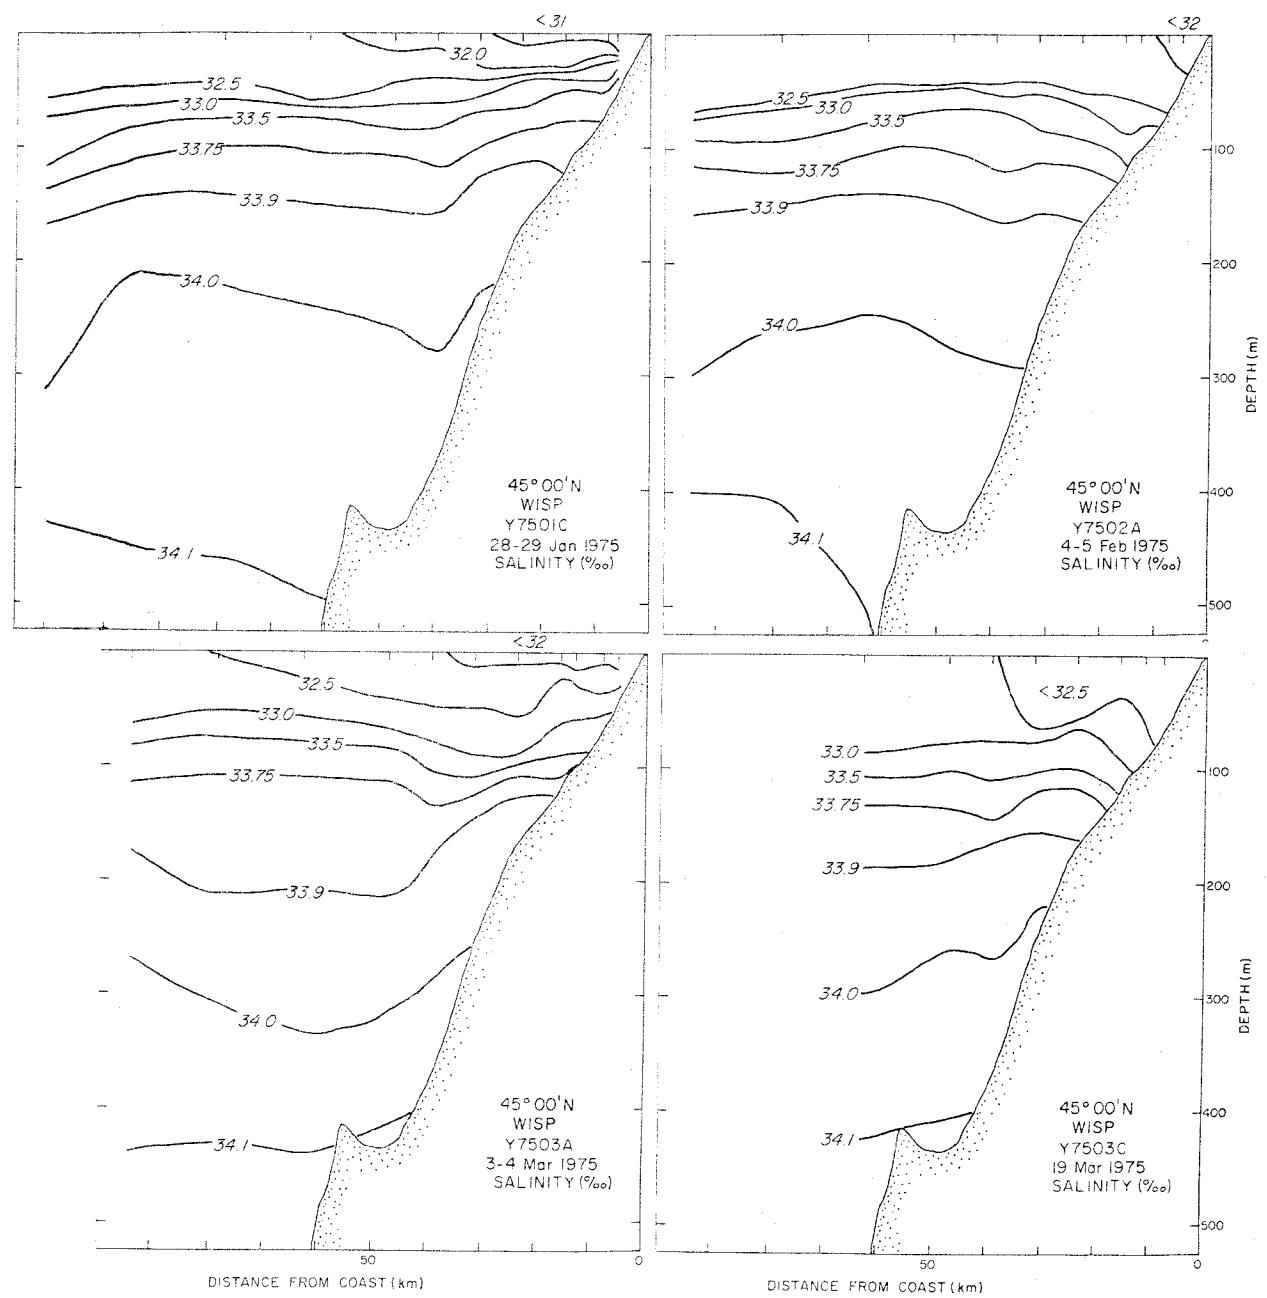

ww = 80 - 99 Showery precipitation, or precipitation with current or recent thunderstorm

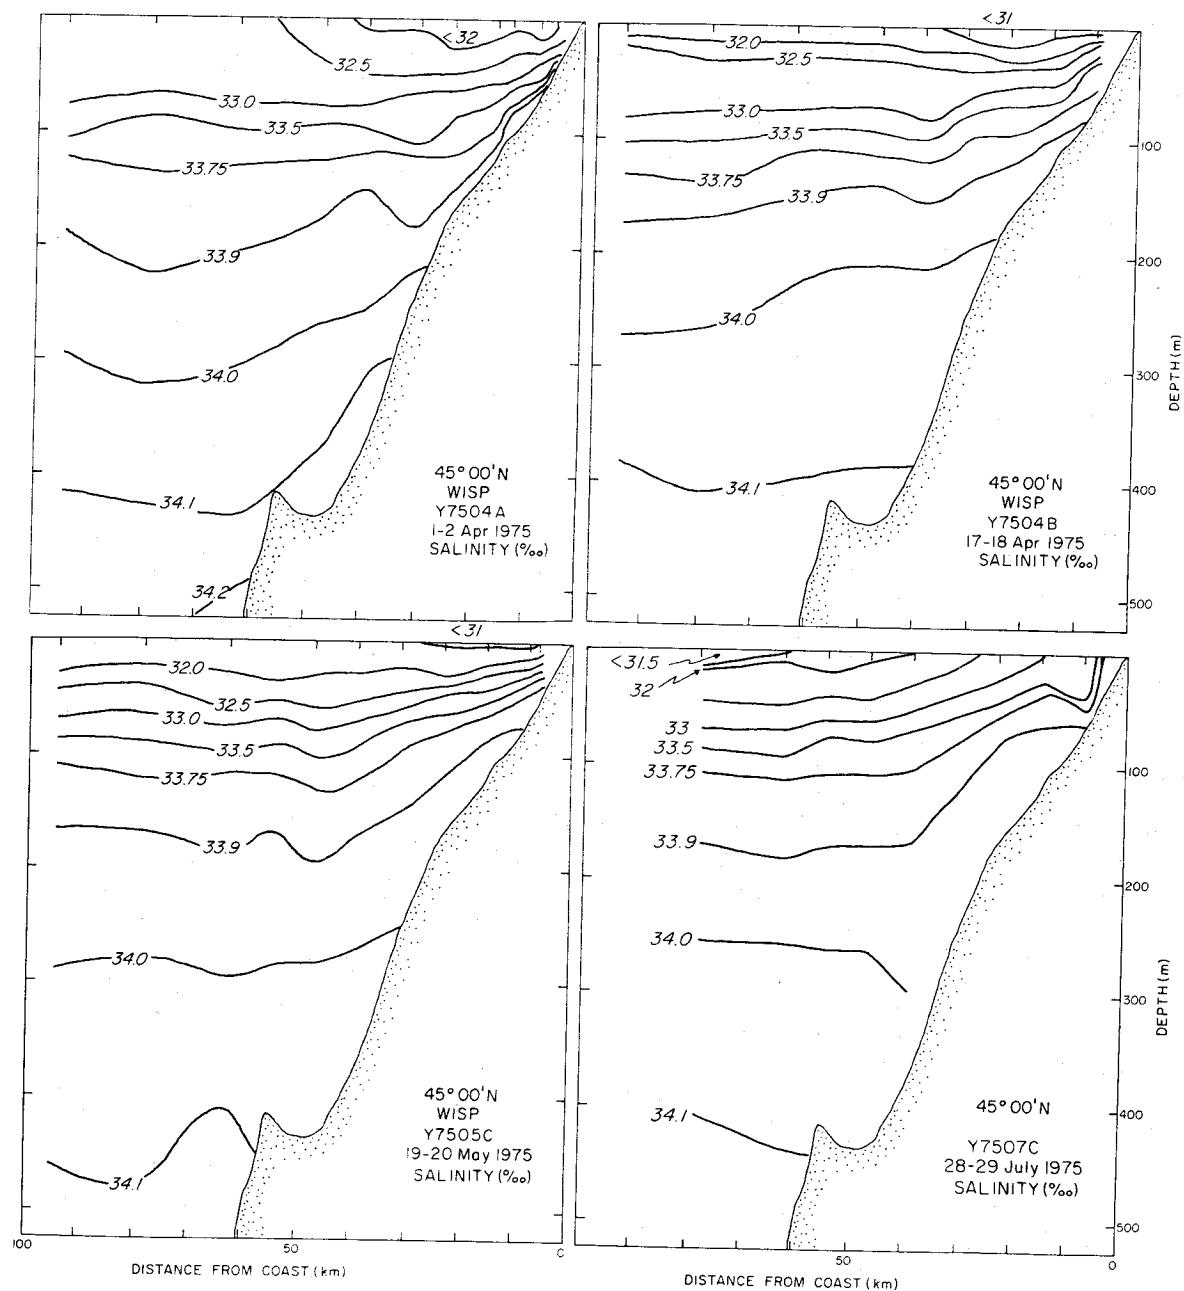

- |    |  |   |
|----|--|---|
| 80 | Rain shower(s), slight   |   |
| 81 | Rain shower(s), moderate or heavy  |   |
| 82 | Rain shower(s), violent  |   |
| 83 | Shower(s) of rain and snow mixed, slight   |   |
| 84 | Shower(s) of rain and snow mixed, moderate or heavy  |   |
| 85 | Snow shower(s), slight   |   |
| 86 | Snow shower(s), moderate or heavy  |   |
| 87 | Shower(s) of snow pellets or ice pellets, type (b), with or without rain                         | { -- slight   |
| 88 | or rain and snow mixed   | { -- moderate or heavy  |
| 89 | Shower(s) of hail, with or without rain or rain and snow mixed, not associated with thunder      | { -- slight   |
| 90 |  | { -- moderate or heavy  |
| 91 | Slight rain at time of observation   |   |
| 92 | Moderate or heavy rain at time of observation  |   |
| 93 | Slight snow, or rain and snow mixed or hail at time of observation                               | { thunderstorm during the preceding hour but not at time of observation |
| 94 | Moderate or heavy snow, or rain and snow mixed or hail at time of observation                    |   |
| 95 | Thunderstorm, slight or moderate, without hail, but with rain and/or snow at time of observation |   |
| 96 | Thunderstorm, slight or moderate, with hail at time of observation                               |   |
| 97 | Thunderstorm, heavy, without hail, but with rain and/or snow at time of observation              | { thunderstorm at time of observation                                   |
| 98 | Thunderstorm, combined with duststorm or sand-storm at time of observation                       |   |
| 99 | Thunderstorm, heavy, with hail at time of observation  |   |

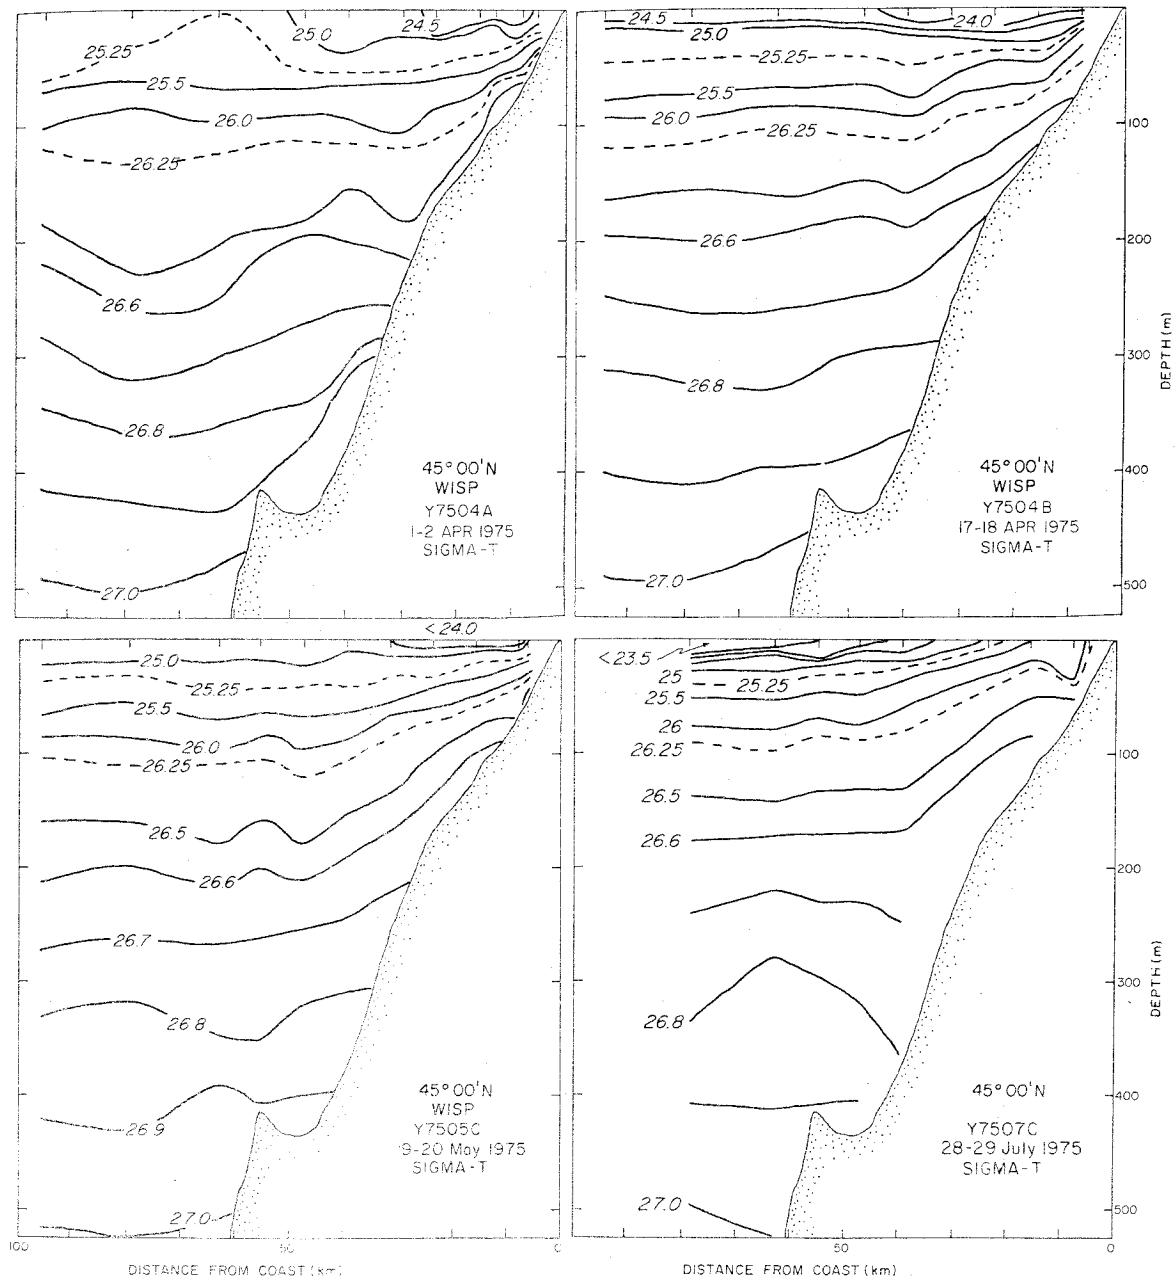

VERTICAL DISTRIBUTIONS OF  
TEMPERATURE, SALINITY AND SIGMA-T

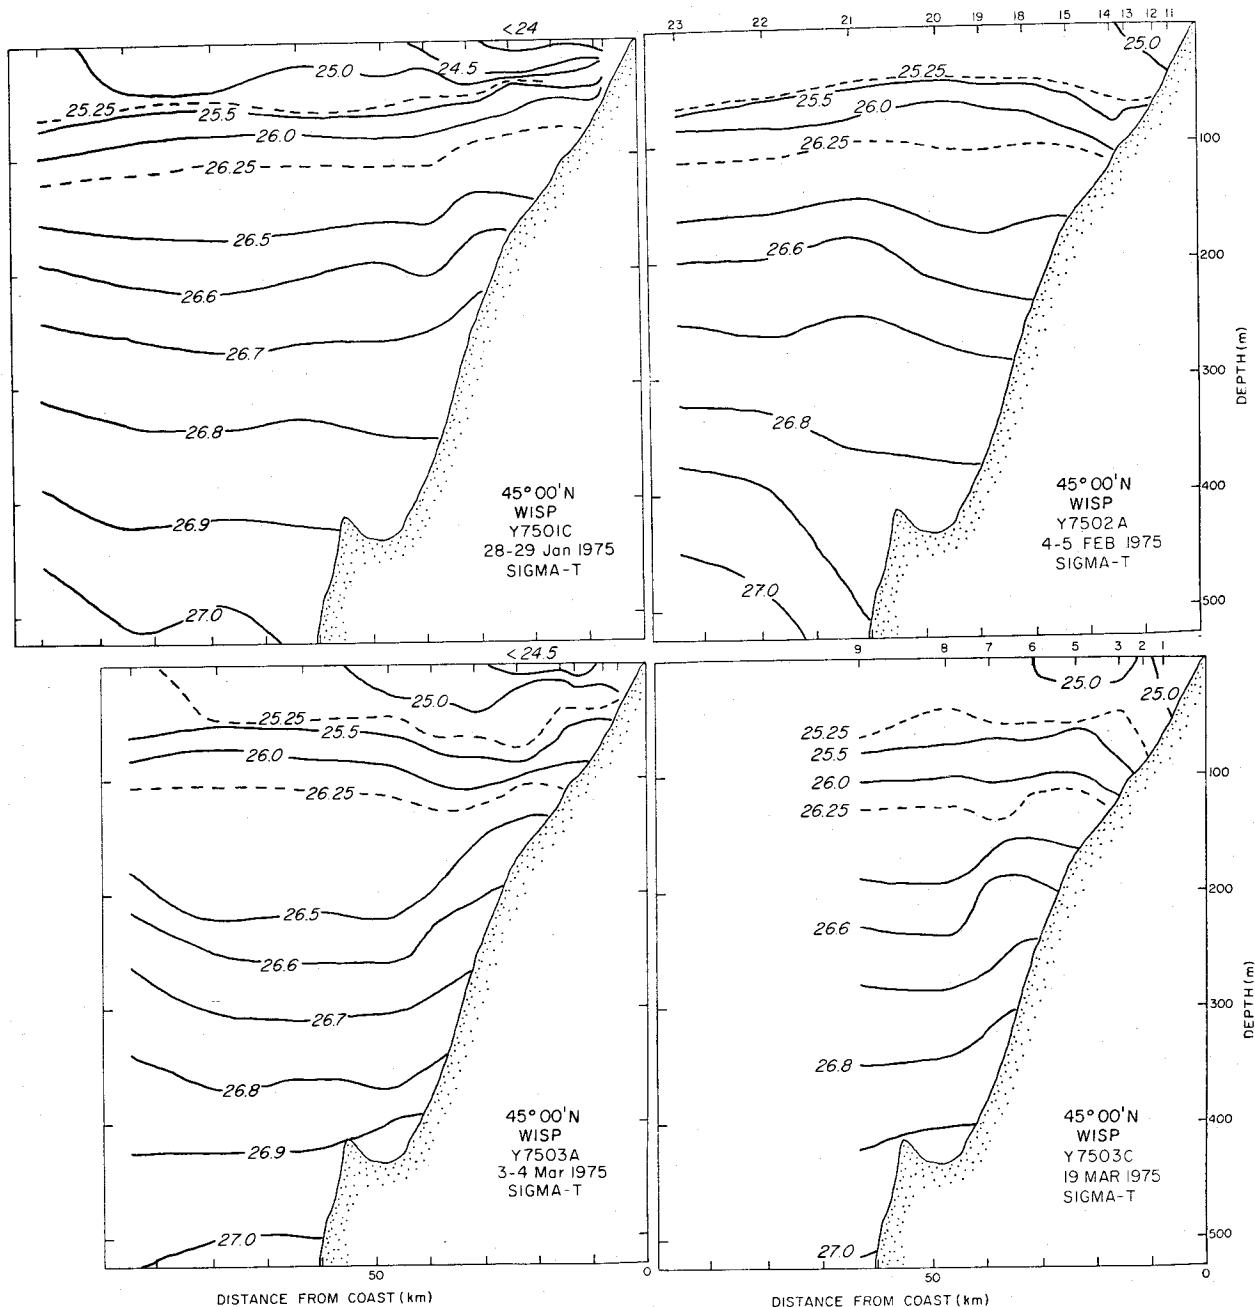

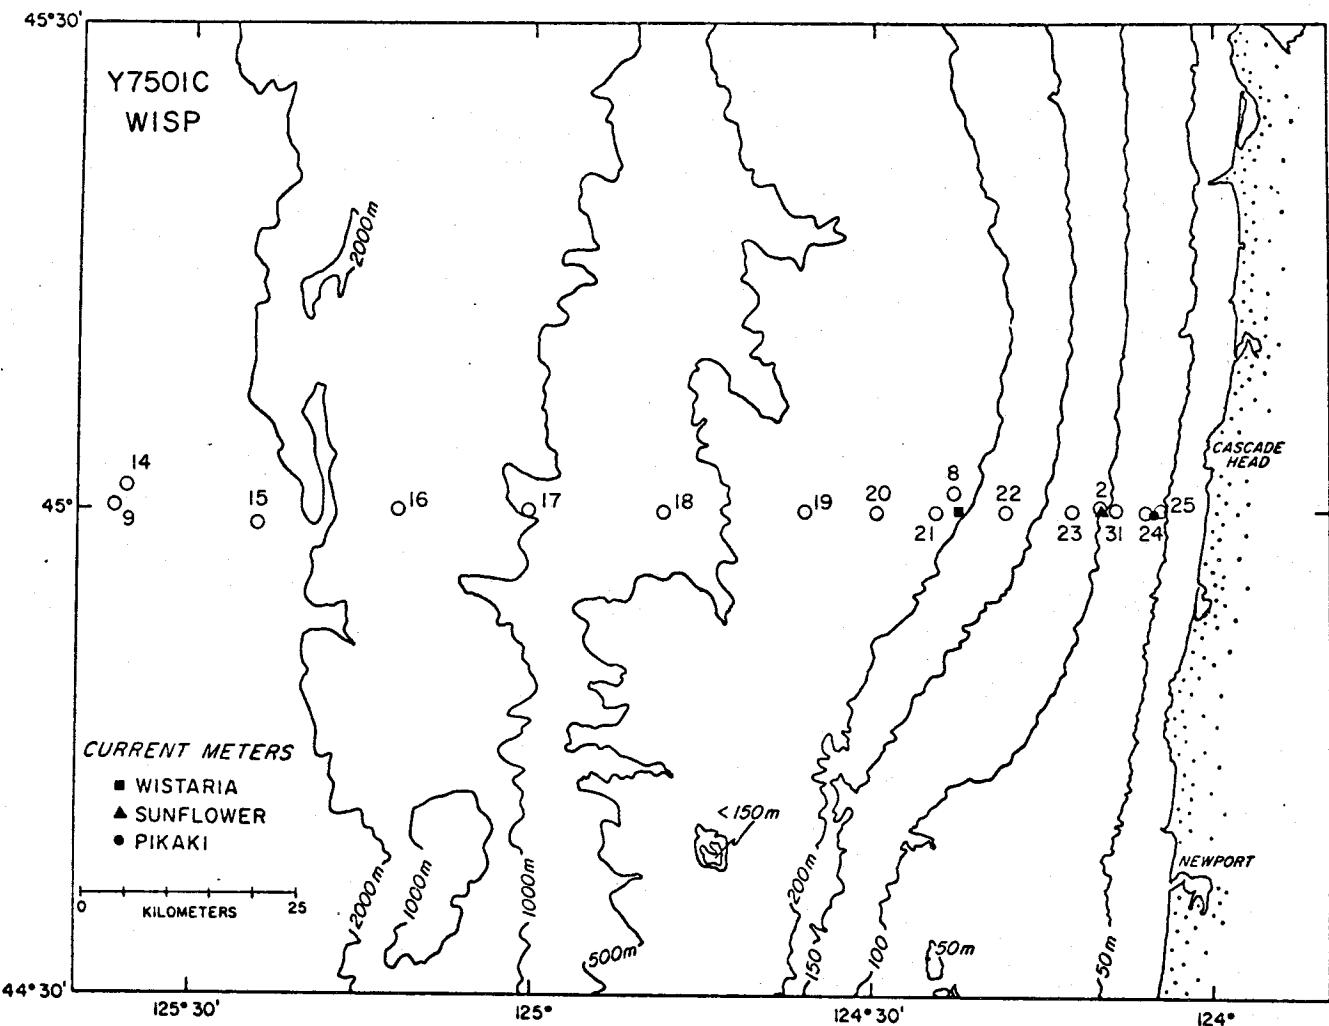

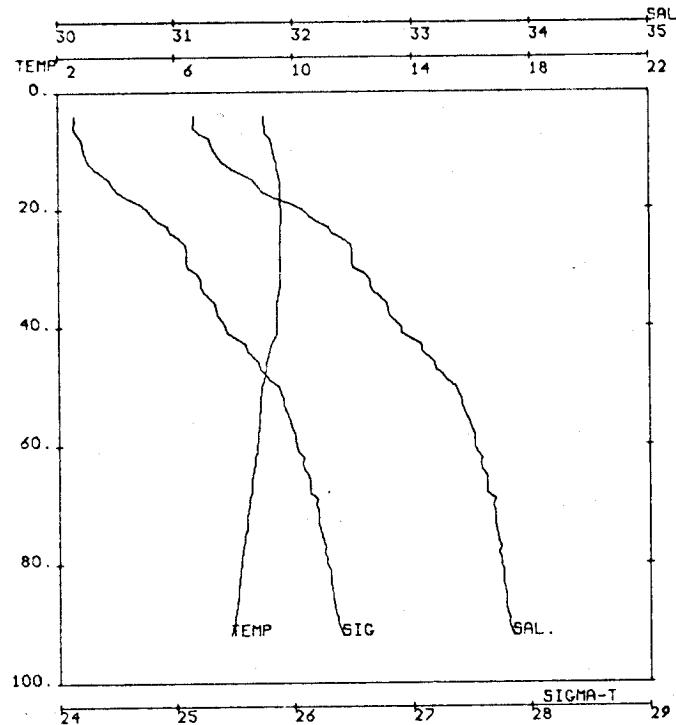

Moored current meters at Wisteria, Sunflower and Pikake. Hydrographic section along 45°N.

Used mainly CTD probe #5. Tested CTD probes #1, 3 and 4.

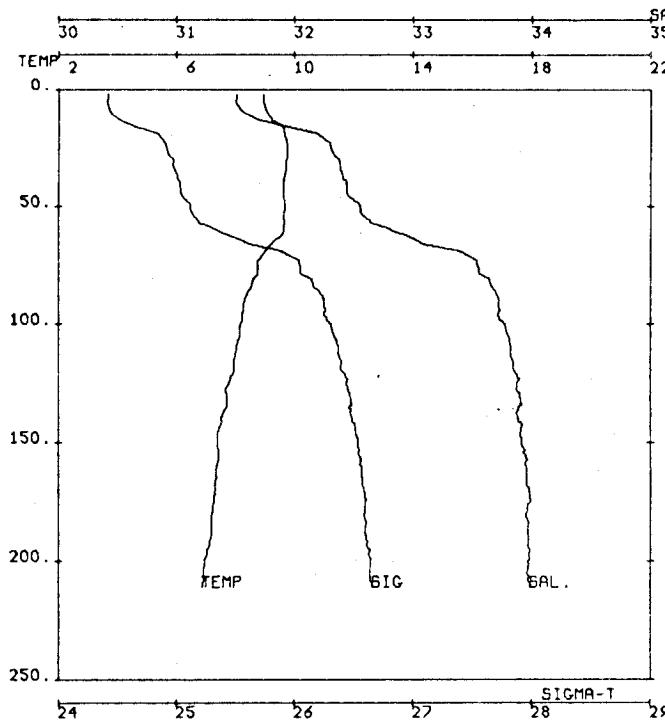

Personnel: Robert L. Smith, E. D. Barton, Dennis Barstow, Robert Kapaun, Tedd Wright, Elizabeth Harris, Eileen Olson, Frank Waite, Dan Thornton, Rich Schramm.

Y7502C  
R/V YAQUINA  
3 - 5 February 1975

Hydrographic section along 45°N.

Used mainly CTD #4; its temperature calibration had drifted since the previous cruise. Tested CTD probes #1 and 3, both of which had spiky conductivity records, and probe #5, which appeared to function properly.

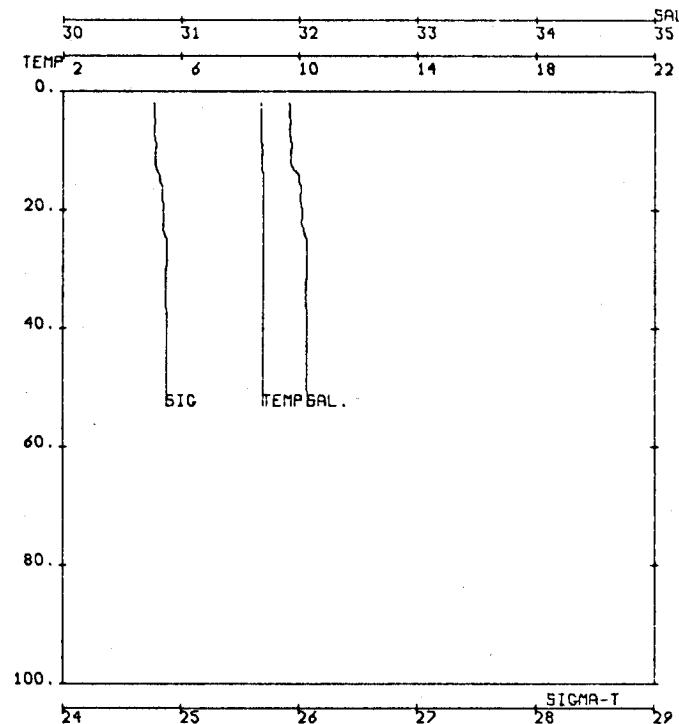

Personnel: Robert L. Smith, Jane Huyer, Dennis Barstow, Ben Moore, Robert Kapaun, Lyn Wilcox, Kathy Lee, Tedd Wright, Jim Wilcox, Francis Kapaun.

Y7503A  
R/V YAQUINA  
3 - 5 March 1975

Hydrographic section along 45°N.

Used mainly CTD probe #3 and 4, which had both been repaired. However, conductivities of probe #3 were still somewhat noisy. Tested probe #1, which still had noisy conductivity data.

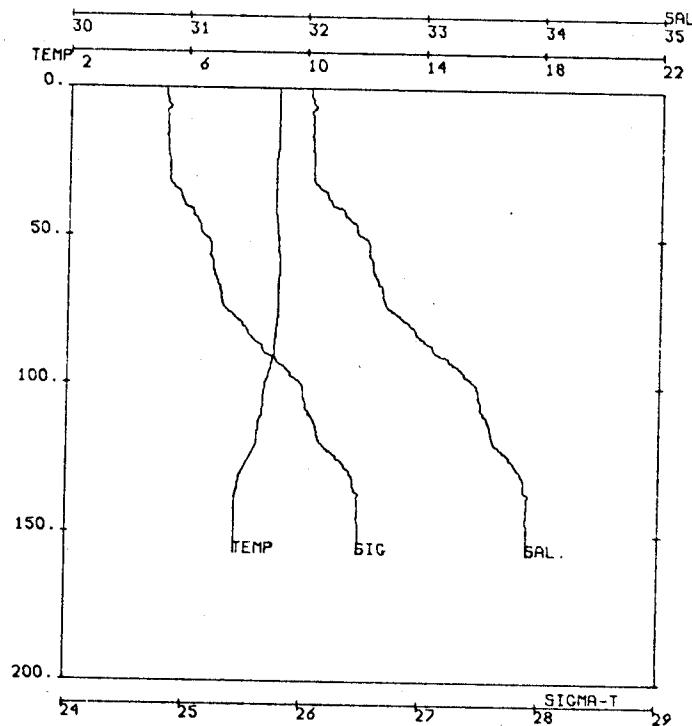

Personnel: Robert L. Smith, Dennis Barstow, Robert Kapaun, Tedd Wright, Henry Pittock, Peter Eberhardt, Cindy Boesser, Suzanne Atiyeh, Ralph Schramm, Tom Sawtell.

R/V YAQUINA  
18 - 22 March 1975

Hydrographic section along 45°N. Used mainly CTD probe #4. Tested CTD probes #1, which was still noisy; #3, which worked all right; and #5, which leaked.

Bar-bound off Newport from Wednesday afternoon (19 March) to Friday evening (21 March). Arrived at Astoria on Saturday evening (22 March). Certificates were presented to participating personnel: Robert L. Smith, Ekki Mittelstaedt, Jane Huyer, Dennis Barstow, Robert Kapaun, Ben Moore, Tedd Wright, Sabine Mittelstaedt, Gene Itzen, Paul Brookhyser.

28 - 29 July 1975

Hydrographic section along 45°N, using CTD probe #1. Instrument appeared to function well during the cruise, but in processing the data it became apparent that the conductivity sensor had behaved erratically. Data from two stations (6, 12) were discarded. The remaining data were processed as usual. The salinity from stations 3 and 5 still disagreed with the sample salinity, and the CTD salinities at these stations was further adjusted by subtracting 0.06 from all salinity data at station 3, and 0.07 from all salinity data at station 5. All salinity data from this cruise is somewhat doubtful, but temperature was apparently measured successfully.

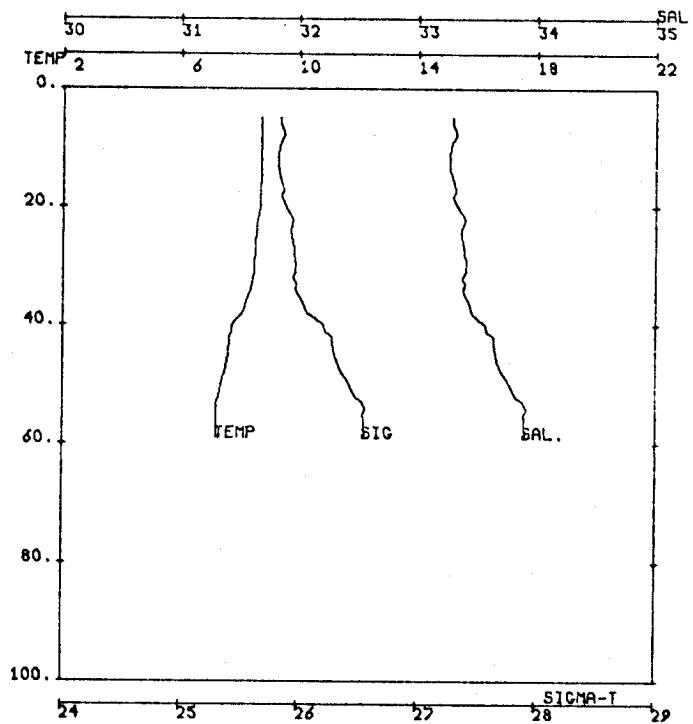

Personnel: Robert L. Smith, Jane Huyer, Dennis Barstow, Ben Moore, Robert Kapaun, Robert Still, Henry Pittock, Dennis Root, James Marthaler, Fred Ramsey, Beth Ramsey, Sean Smith, David Still, Dee Stewart, Rich Schramm, Jerry Bertrand.

### Acknowledgments

Dennis Barstow, Robert R. Kapaun and Ben A. Moore were instrumental in collecting the data. Dennis Root and Joseph Bottero processed the Aanderaa records. We also wish to thank Robert Still, Rod Mesecar, Dale Pillsbury and Karie Tamura for assistance, and Coryl Christenson for designing the commemorative certificates.

WISP was funded by the National Science Foundation under grant DES 74-22290. UP-75 was part of the Coastal Upwelling Ecosystems Analysis program supported by the Office for the International Decade for Ocean Exploration under grant ID071-04211.
