The Problem: Fork-lift piling of lumber packages without bolsters.

The Answer: Use wood wedges. They are made of two 2-inch boards. Taper them and make them about as long as half the package width. Attach steel loop in large end for pulling out.

1. Place wedges on edge just outside of fork positions with sticker on top.

2. Place top package to rest on wedges and back edge of lower package.

3. Pull forks back and lift front edge of top package with tips of forks.

4. Remove wedges.

5. Lower front edge of top package with tips of forks.
